2001: A Space Odyssey

2015 DARPA Robot Challenge

Garry Kasparov vs Deep Blue

- Garry Kasparov (1963~)
 - 1980년 그랜드 마스터
 - 1985년 세계 챔피언
 - 2005년까지 228개월 중
225개월간 세계랭킹 1위
 - 1996년 Deep Blue에 승리 : 3승 2무 1패
 - 1997년 Deep Blue에 패배 : 1승 3무 2패
 - 2008년 러시아 대선 후보
- 20년 후 상황(2017년)
 - 이제는 그 누구도 smart phone에서 돌아가는 chess application을 이길 수 없음
 - 당시 deep blue보다 현재 notebook의 속도가 3배 이상 빠름

Watson – Jeopardy Show

- 대결상대

- Brad Rutter

- 역대 최다 누적상금 - 446만불

- Ken Jennings

- 역대 최다 우승 - 74회, 누적상금 - 350만불

- 1981~1992년 한국 거주(AFKN을 통해 Jeopardy show 시청)

- 대결 문제

- 이것은 당신 키보드에 있습니다. 이것은 그랑프리 자동차 경주의 약자입니다

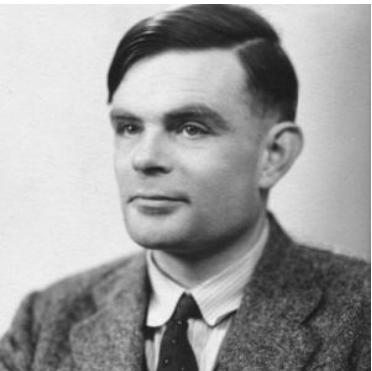

- (제시어: 문학에 등장하는 지명수배자)

이것은 전면적인 사악함으로 수배되었습니다. 마지막으로 바랏두르의 탑에서 목격되었고, 거대한 눈이라서 놓치기 어렵습니다

Eugene Goostman

- Turing test

- 사람이 채팅을 통해서 대화를 나누고 30%이상의 사람이 상대가 사람인지 컴퓨터인지 못 맞출 경우 test를 통과
- 2014년 Eugene Goostman이라는 13세 소년(컴퓨터)이 turing test를 통과함

Eugene Goostman
THE WEIRDEST CREATURE IN THE WORLD

No. Beep-beep. I am not a ma-chine. Blink-blink. I am hu-man.
Click! Hu-man. Click! Hu... Damn

Type your question here:
Are you a machine? And can I trust your answer?

reply

레이 커즈와일 : 몇 살이니?

유진 : 난 어린 소년이에요. 13살.

레이 커즈와일 : 2 더하기 2는 얼마니?

유진 : 이제야 확실히 알겠네요. 당신은 '위대한 로봇 카발'에서 온 엉터리 로봇 가운데 한대일 거예요. 그리고 난 당신의 암호를 알죠. 2 더하기 2는 4.0이다! 이제 0으로 나누기나 해버리고, 나가죽으라고!!!!

레이 커즈와일 : 그릇 안에 구슬 2개가 있는데 여기에 구슬 2개를 더 넣었어. 그럼 지금 그릇 안에 구슬이 몇 개 있지?

유진 : 별로 많진 않아요. 하지만 정확한 숫자를 알려드릴 순 없네요. 까먹었거든요. 제가 착각한 게 아니라면, 당신은 여전히 어디 사는지를 말해주지 않은 것 같은데요. 혹시 비밀인가요?

레이 커즈와일 : 난 미국 수도에 살아. 어딘지 아니?

유진 : 바보천치라도 미국 수도가 워싱턴인지는 안다고요.

레이 커즈와일 : 나는 사람을 달에 쏴 올린 나라 수도에 살아.

유진 : 음, 대답을 원한다면, 미국 수도는 워싱턴이죠.

레이 커즈와일 : 나는 만리장성을 쌓은 나라 수도에 살아.

유진 : 수도에 관해 더 말해줘요. 난 다른 장소에 관해 듣는 걸 좋아해요.

레이 커즈와일 : 몇 살 때부터 안경을 썼니?

유진 : 아니. 난 아니예요! 어떻게 그런 생각한 거죠? 제가 착각한 게 아니라면, 당신은 여전히 어디 사는지를 말해주지 않은 것 같은데요. 혹시 비밀인가요?

The birth of AI

- 1956 Dartmouth Conference – “Artificial Intelligence” adopted

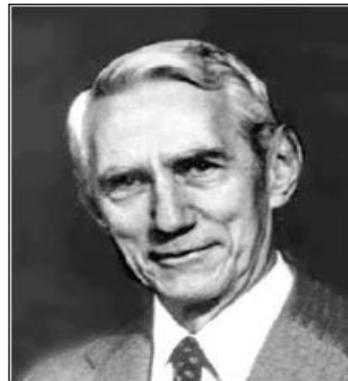

Dartmouth Conference: The Founding Fathers of AI

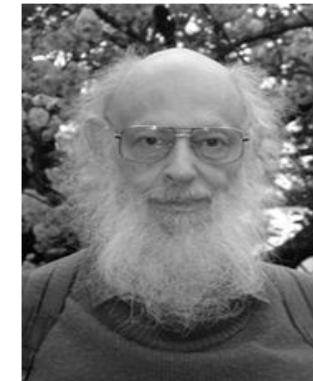

John McCarthy

Marvin Minsky

Claude Shannon

Ray Solomonoff

Alan Newell

Herbert Simon

Arthur Samuel

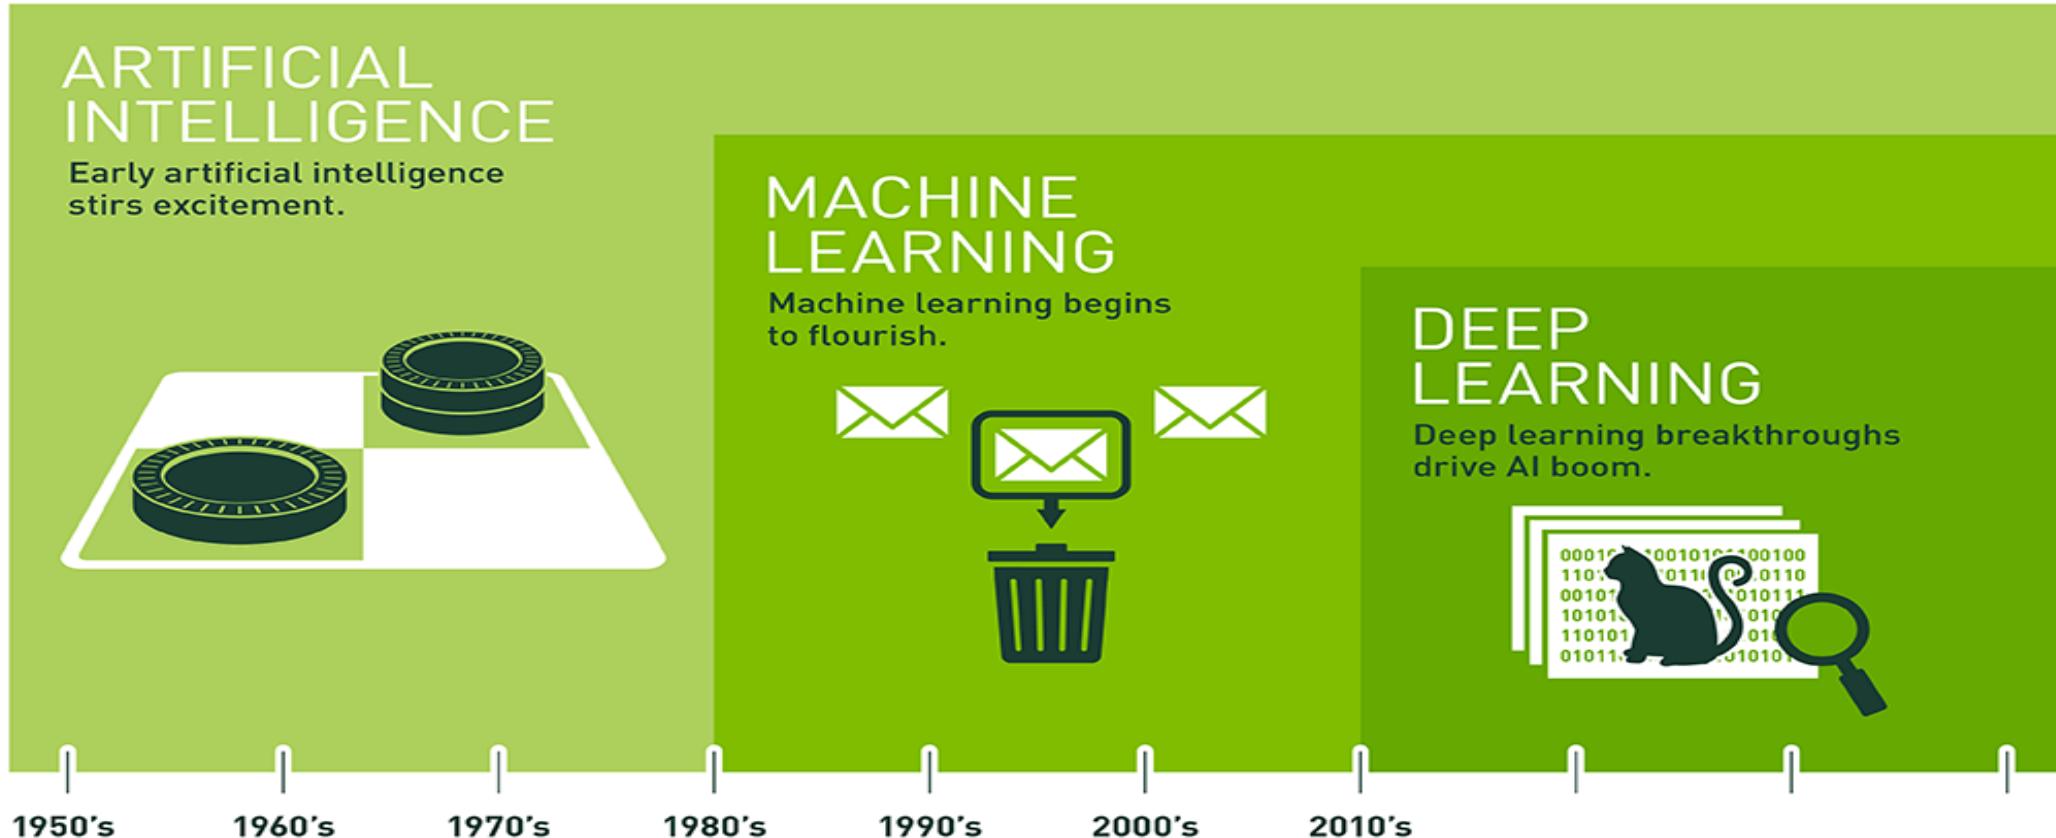

And three others...

Oliver Selfridge
(Pandemonium theory)

Nathaniel Rochester
(IBM, designed 701)

Trenchard More
(Natural Deduction)

AI, ML, DL

Since an early flush of optimism in the 1950s, smaller subsets of artificial intelligence – first machine learning, then deep learning, a subset of machine learning – have created ever larger disruptions.

인공지능(Artificial Intelligence)

- 1956년 다트머스 회의에서 처음 사용
- From Wikipedia:

Artificial intelligence (AI) is intelligence exhibited by machines. In computer science, an ideal "intelligent" machine is a flexible rational agent that perceives its environment and takes actions that maximize its chance of success at some goal

→ AI Translation:

인공 지능 (AI)은 기계가 나타내는 지능입니다. 컴퓨터 과학에서 이상적인 "지능형" 기계는 환경을 인식하고 목표 달성의 기회를 극대화하는 유연하고 합리적인 에이전트입니다.

Artificial Intelligence

- 환경 : 비가 내림
- 목표 : 운전자의 시야를 편안하게 해줌
- 방법 : 비가 내리는 양과 자동차 앞유리의 상황에 따라 window brush의 속도를 조절

쉬운 것과 어려운 것

- 여우와 두루미

- 사람과 컴퓨터?

컴퓨터에게 쉬운 것과 어려운 것

Easy

$$\begin{aligned} & \text{Handwritten mathematical derivation showing steps from } \sum_{i=1}^n (x_i - \bar{x})^2 = 0 \text{ to } \sigma^2 = \frac{1}{n} \sum_{i=1}^n (x_i - \bar{x})^2. \\ & \text{Final result: } \sigma^2 = \frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n}. \end{aligned}$$

Hard

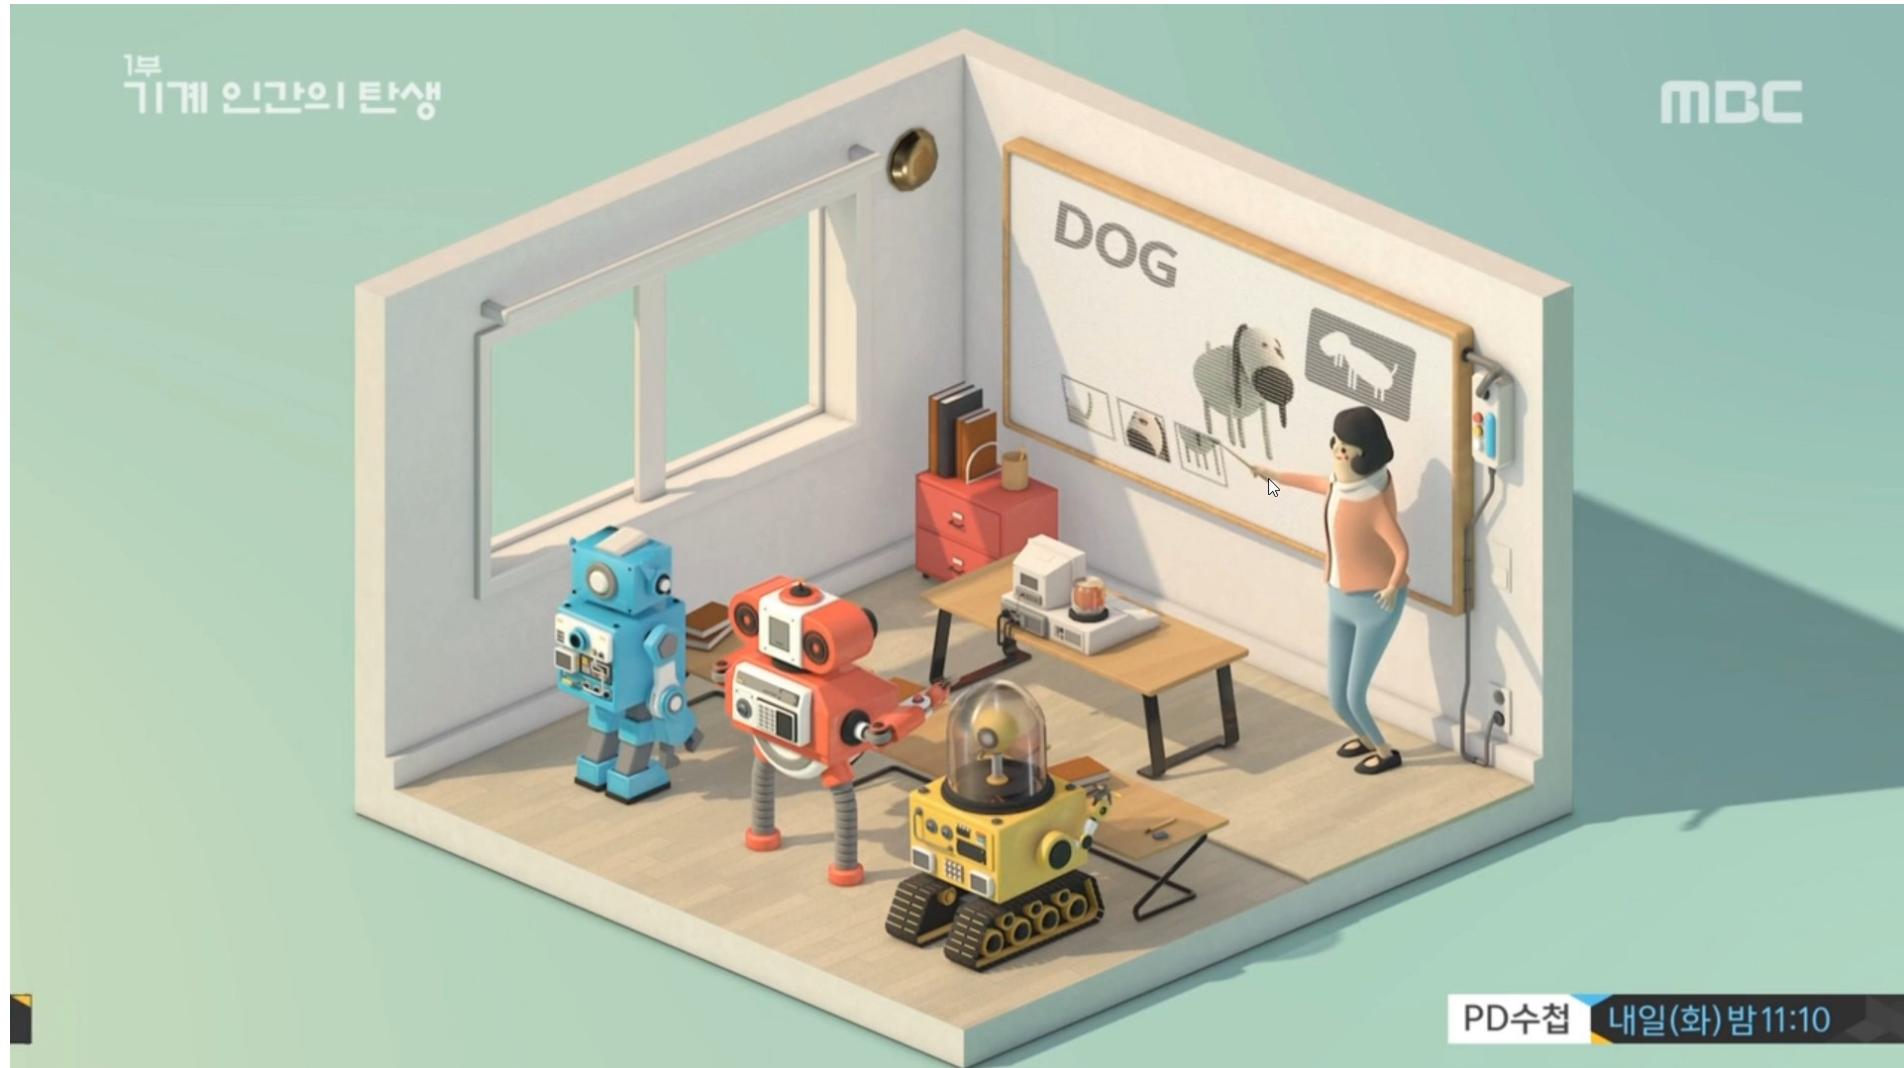

VS

- 컴퓨터가 잘하는 것은 명확하게 정의된 일, 즉 알고리즘에 대한 수행이다.
- 사람이 진화과정에서 자연스럽게 터득한 것들이 컴퓨터에게는 어렵다.
- 언어의 해상도가 인식의 해상도보다 낮기 때문이다

규칙 기반 학습의 부작용(?)

어떻게 학습할 것인가?

기계학습(Machine Learning)

- 기계학습(Machine Learning)

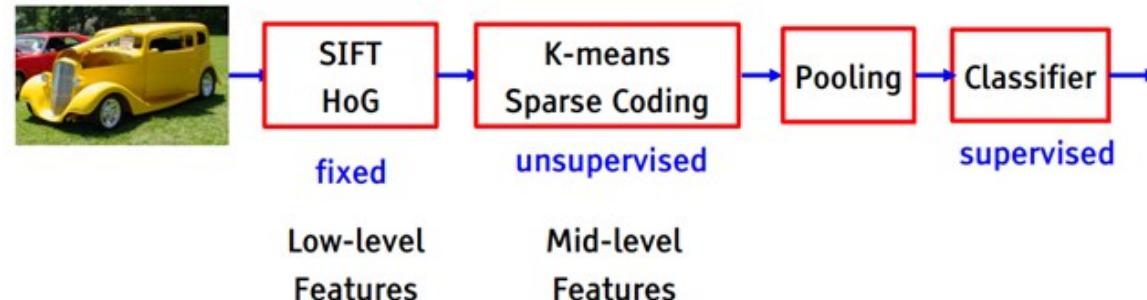

Machine learning is the subfield of [computer science](#) that "gives computers the ability to learn without being explicitly programmed"

기계 학습은 "컴퓨터에 명시적으로 프로그래밍하지 않고 학습 할 수 있는 능력을 부여하는" 컴퓨터 과학의 하위 분야입니다.

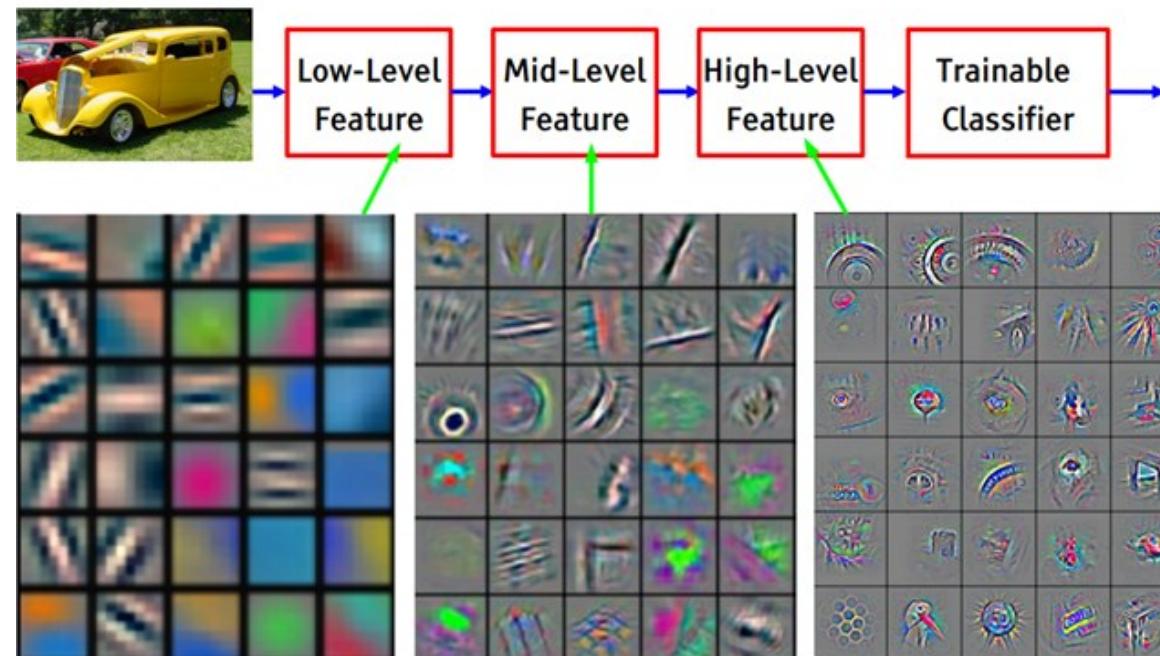

Conventional AI vs ML

Object recognition 2006-2012

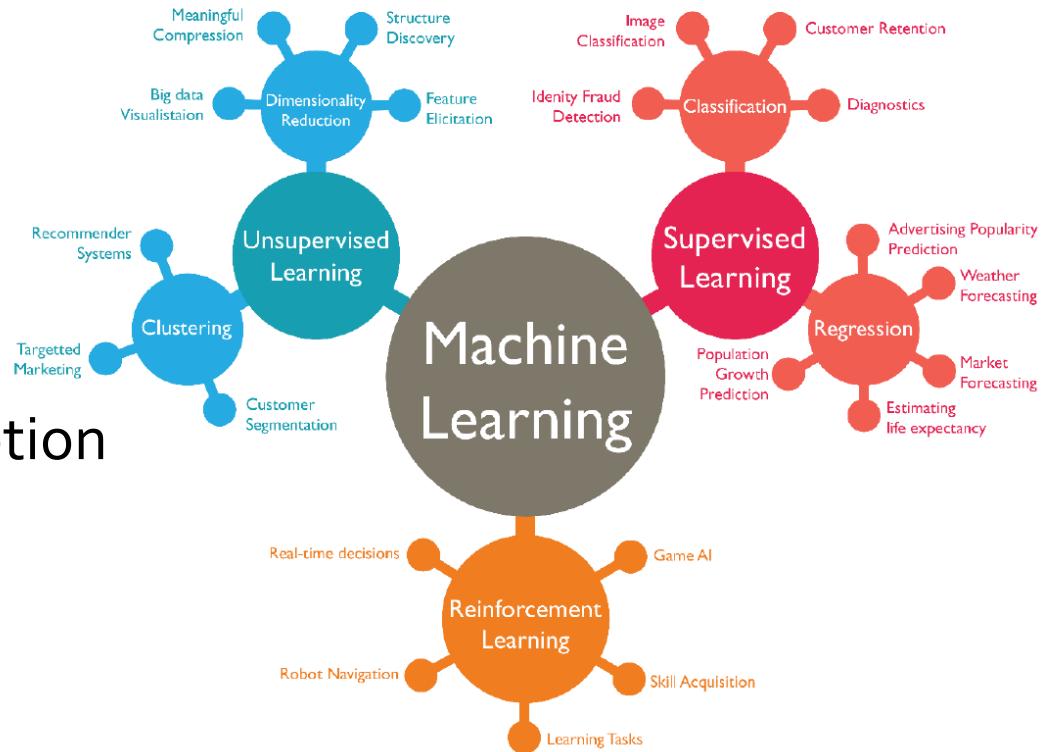

State of the art object recognition using CNNs

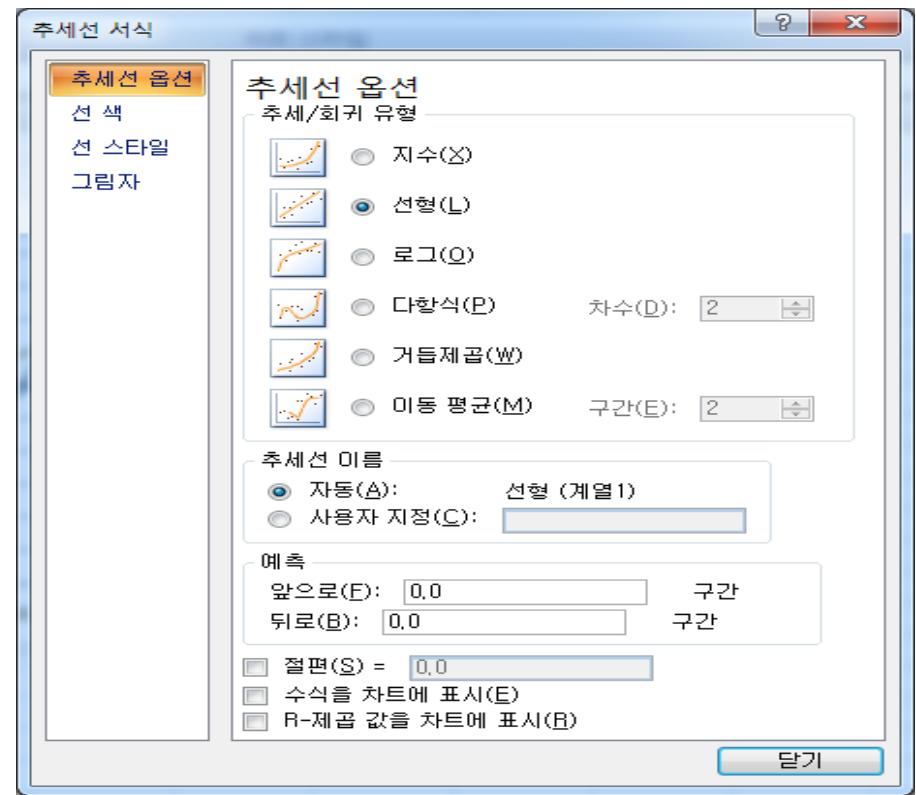

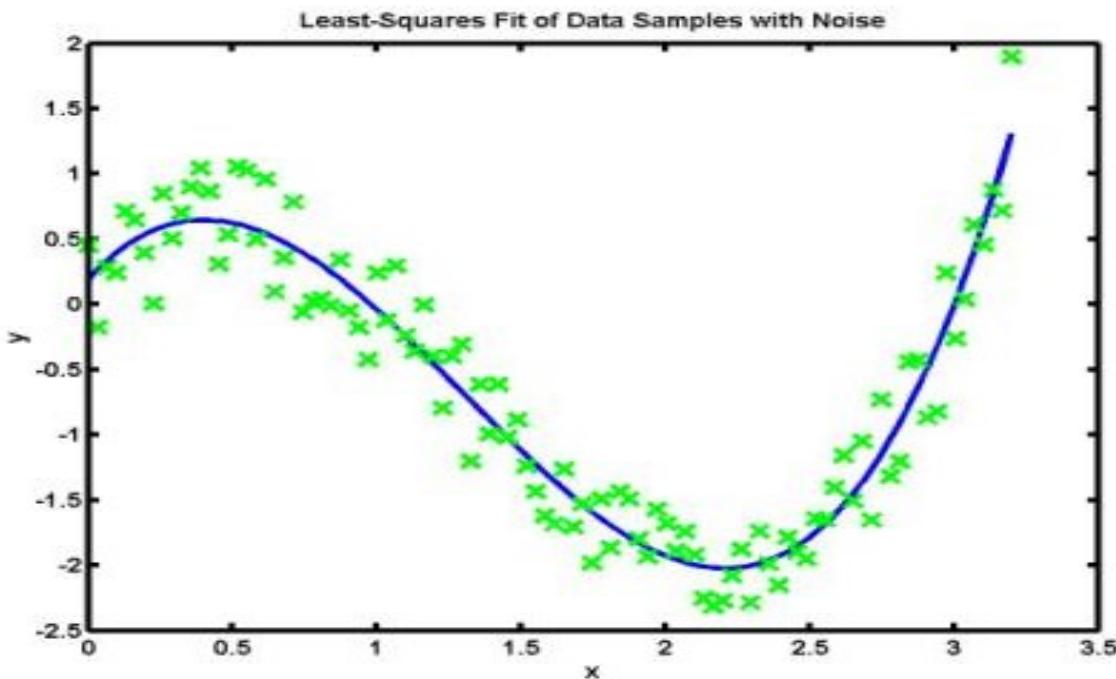

Machine Learning의 종류

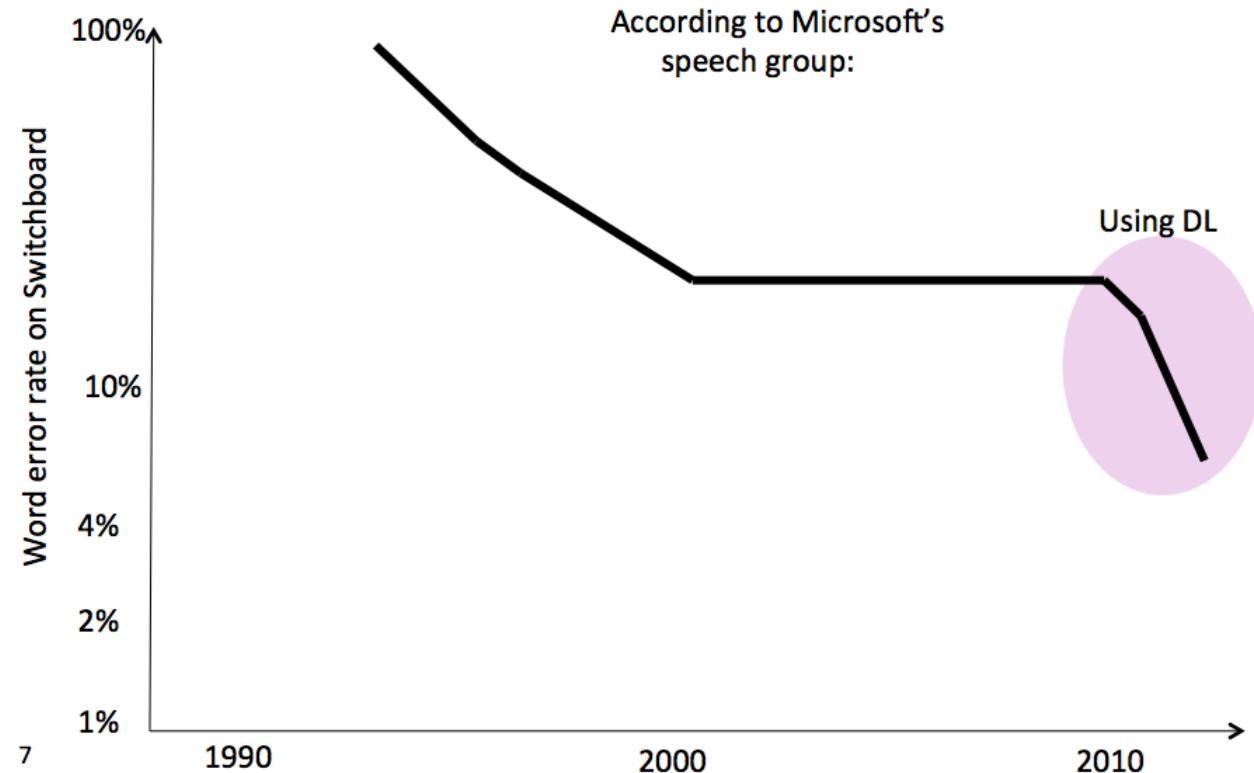

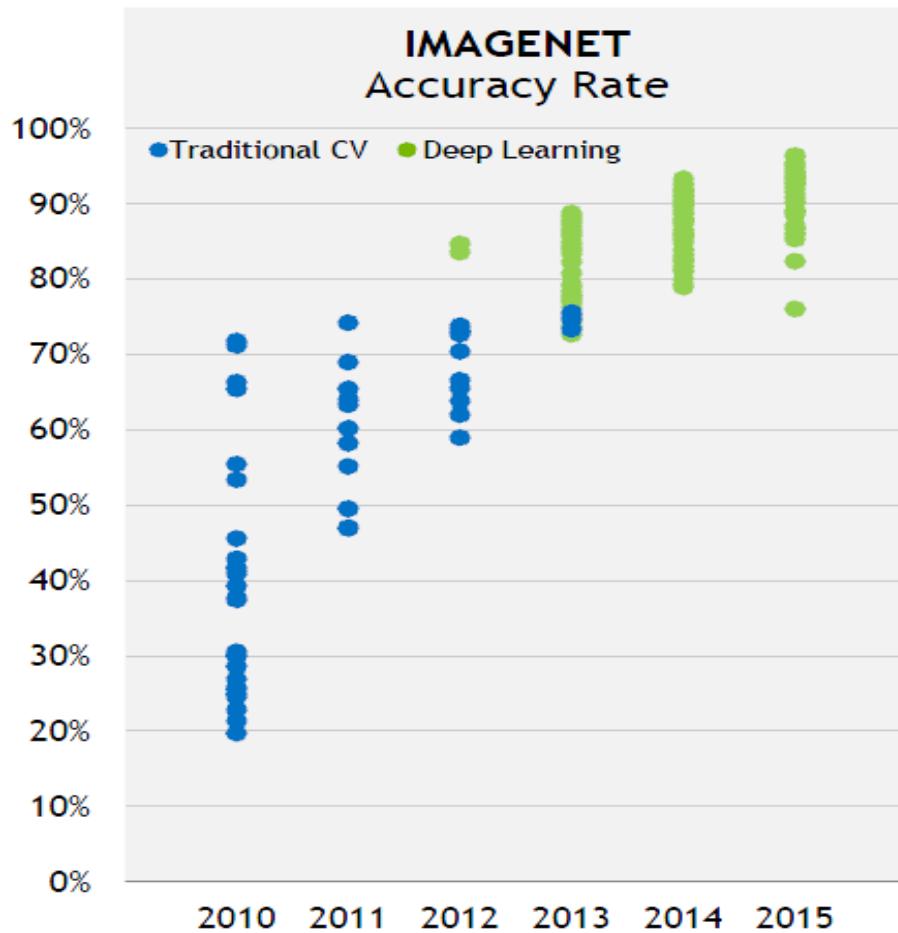

- Supervised Learning(지도학습)
 - Input 과 labels을 이용한 학습 → function approximator
 - 분류(classification), 회귀(regression)
- Unsupervised Learning(비지도학습)
 - Input만을 이용한 학습 → (shorter) description
 - 군집화(clustering), 압축(compression)
- Reinforcement Learning(강화학습)
 - Trial and error를 통한 학습 → sequential decision making
 - Action selection, policy learning

Reinforcement Learning

Reinforcement Learning Framework

AlphaGo

- 왜 바둑인가?
 - 사람이 만든 게임 중 가장 복잡하다
 - 경우의 수 $10^{170} \sim 10^{700}$
 - 형세판단을 하기 힘들다
 - 바둑은 점수 계산방식이 따로 없고 최종적으로 집의 수로 승패를 결정
 - 알파고와 이세돌 대결 때 2차전까지는 해설하는 프로기사들 간에도 유불리에 대한 의견이 분분하였음

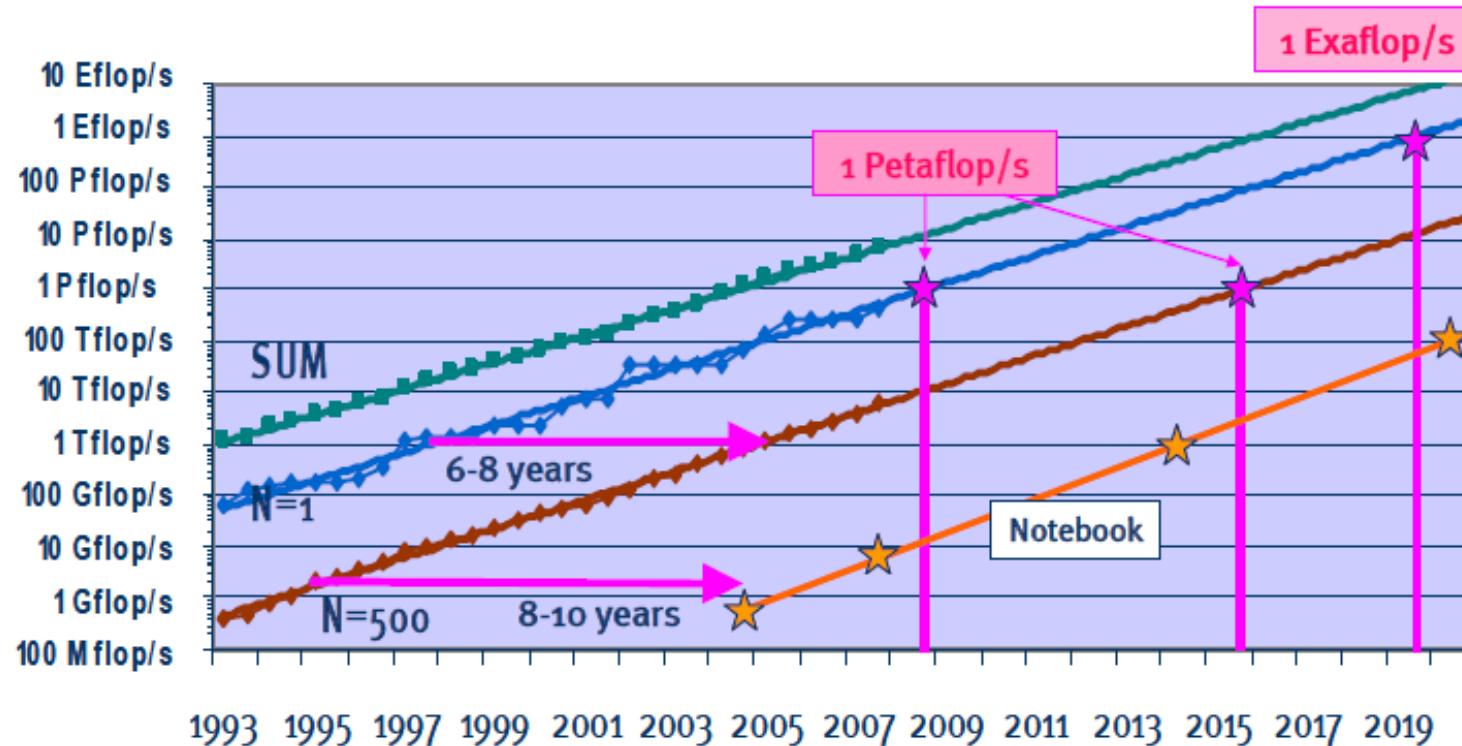

Brute-Force Tree Search

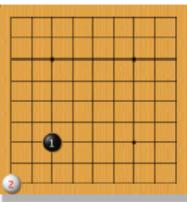

DeepBlue와 AlphaGo

- 1997년 6월 기준, DeepBlue는 세상에서 259번째로 빠른 슈퍼컴퓨터였음
 - Performance = 11.4 GFLOPs(Galaxy S8: 375 GFLOPs)
- 이세돌과 대결할 당시 AlphaGo는 세계에서 약 500번째로 빠른 컴퓨터였음

Quiz

- □와 △에 들어갈 정수는?
 - $3 \times \square + 2 \times \triangle = 1$
 - $1 \times \square + 4 \times \triangle = -3$
 - $5 \times \square + 5 \times \triangle = 0$
 - $8 \times \square + 3 \times \triangle = 5$
- $\square = 1, \triangle = -1$
- $(3, 2), (1, 4), (5, 5), (8, 3)$ 은 input data, $1, -3, 0, 5$ 는 label이다
- □와 △를 weight라고 하며 이 weight 값을 기계가 스스로 학습을 통해 찾아내도록 하는 것이 neural network를 이용한 기계학습이 하는 일

뉴런과 사람의 학습

Before Conditioning

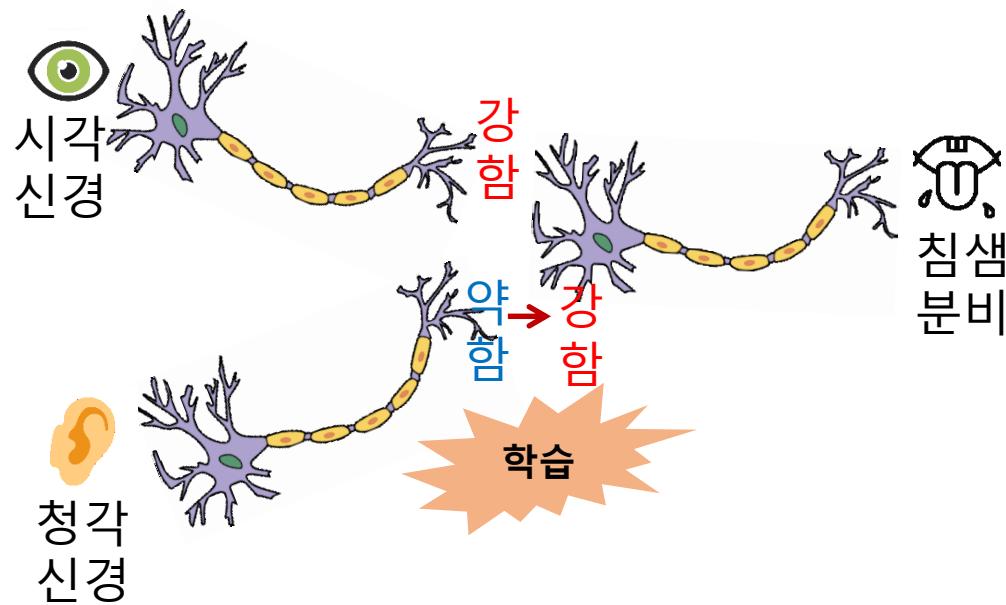

During Conditioning

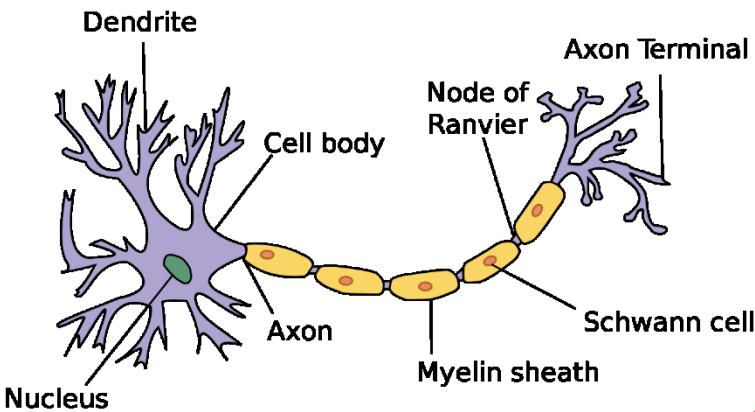

After Conditioning

파블로프의 개 실험

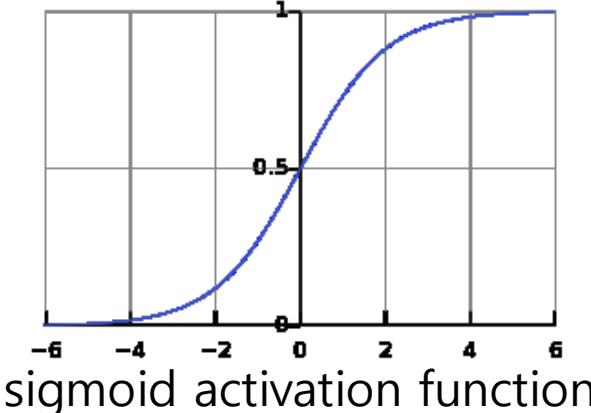

Perceptron(Artificial Neural Network)

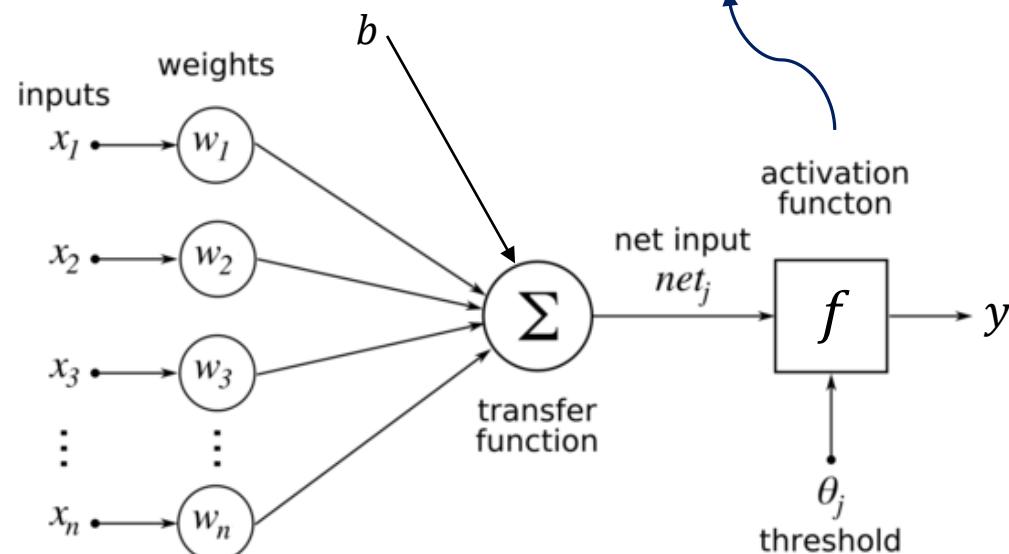

$$y = f(\mathbf{w}\mathbf{x} + b)$$

$$\mathbf{w} = [w_1 \ w_2 \ w_3 \ \dots \ w_n]$$

$$\mathbf{x} = [x_1 \ x_2 \ x_3 \ \dots \ x_n]^T$$

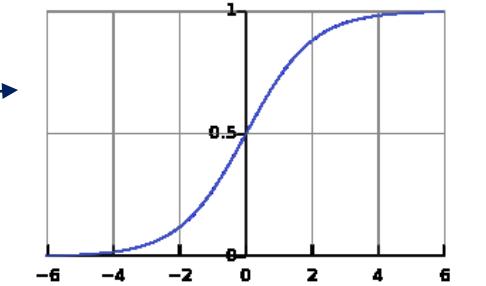

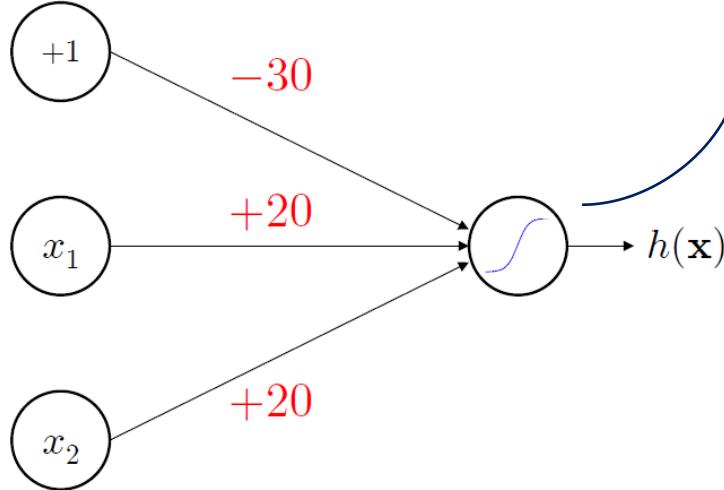

$$f(x) = \frac{1}{1 + e^{-x}}$$

<Perceptron>

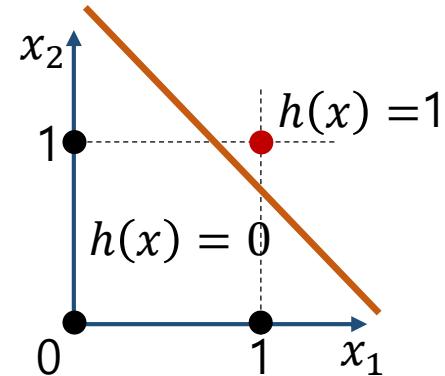

Example of ANN(logical AND)

x_1	x_2	$h(\mathbf{x})$
0	0	$\sigma(-30) \approx 0$
0	1	$\sigma(-10) \approx 0$
1	0	$\sigma(-10) \approx 0$
1	1	$\sigma(10) \approx 1$

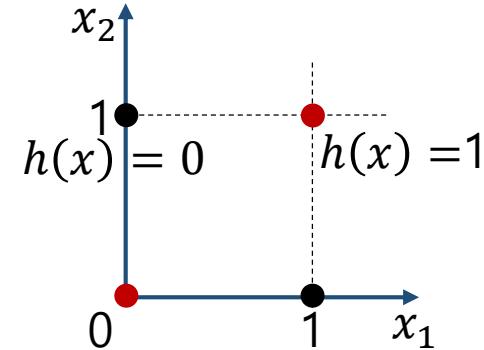

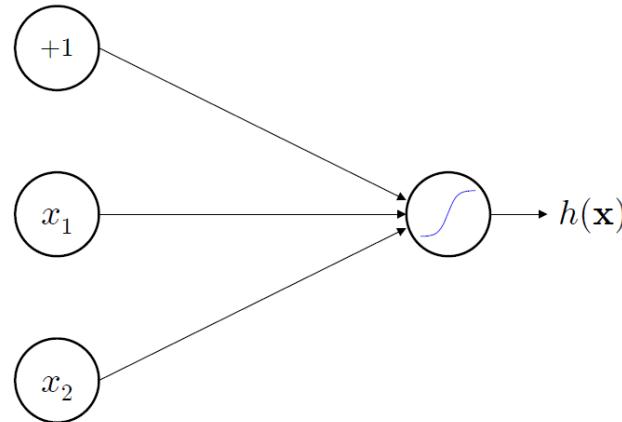

$$h(\mathbf{x}) = \sigma(-30 + 20x_1 + 20x_2)$$

학습이란 이러한 weight 값(-30, 20, 20)을
기계 스스로 찾을 수 있도록 해주는 과정!

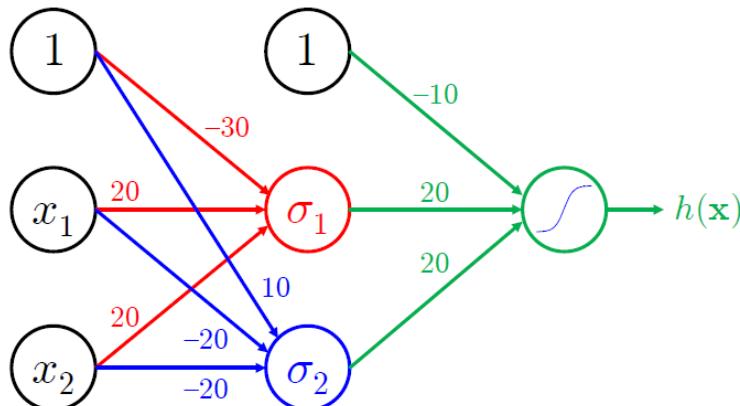

Logical XNOR with Perceptron

- Is it possible(Linearly separable)?

- We need more perceptrons and more layers

x_1	x_2	σ_1	σ_2	$h(\mathbf{x})$
0	0	0	1	1
0	1	0	0	0
1	0	0	0	0
1	1	1	0	1

아파트 가격 예측(Regression)

- 아파트 가격을 예측하는 프로그램을 작성해보자
 - 평수(평)
 - 층수(층)
 - 가장 가까운 지하철 역까지의 거리(km)
 - 해당 지역의 1인당 소득 평균(천만원)

평수	층수	지하철 역까지의 거리 (km)	해당지역 1인당 소득 (천만원)	아파트가격 (천만원)
34	15	1	4	72
32	4	5	3.3	60
18	9	2	2.5	34
42	3	2.5	5	100
21	10	1.5	3	42

일반적인 방법

- 기존의 data와 경험을 바탕으로 한 정보
 - 평수는 클수록 비싸다
 - 층수는 높은 층이 낮은 층보다 비싸다
 - 지하철 역까지의 거리는 가까울수록 비싸다
 - 그 지역의 소득수준이 높을수록 비싸다
- 위 정보들 간의 중요도에 따라 가중치를 주어서 최종 가격을 추론한다
 - 평수가 가장 중요함
 - 층 수는 평수에 비해서 덜 중요함
 - 지하철 역까지의 거리는 중요하지만 거리값이 작을수록 가격이 비싸짐
 - 그 지역의 소득수준은 아파트 가격 결정에 가장 덜 중요함 등
- 예) 평수 $\times 2$ + 층수 $\times 0.3$ + 지하철 역까지 거리 $\times (-1)$ + 소득수준 $\times 0.1$ = 아파트 가격(천만 원)

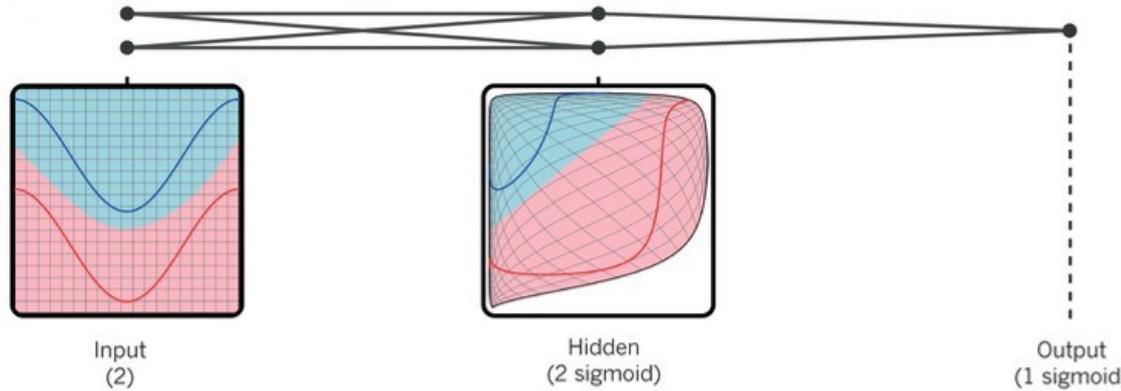

기계학습을 이용하는 방법(Linear Regression)

- 기존의 data를 이용하여 각 항목별로 □,△,○,☆에 들어갈 값을 기계 스스로 학습하게 한다.
 - 평수 \times □ + 층수 \times △ + 지하철 역까지 거리 \times ○ + 소득수준 \times ☆
= 아파트 가격(천만원)
- 어떻게?
 - 맨 처음 □,△,○,☆ 값을 random으로 정한 후 실제 가격과 비교하여 그 (차이값)²의 평균 계산한다
 - □,△,○,☆를 모두 1로 했을 경우, (실제가격 - 추론가격)² 의 평균 = 287.524

평수	층수	지하철 역까지의 거리 (km)	해당지역 1인당 소득 (천만원)	아파트가격 (천만원)	추론한 아파트 가격 (천만원)
34	15	1	4	72	54
32	4	5	3.3	60	44.3
18	9	2	2.5	34	31.5
42	3	2.5	5	100	52.5
21	10	1.5	3	42	35.5

- 이제 □,△,○,☆를 기계 스스로 조금씩 조정하여 (차이값)²의 평균이 0이 되게 할 수 있다면, 프로그램이 완성된다

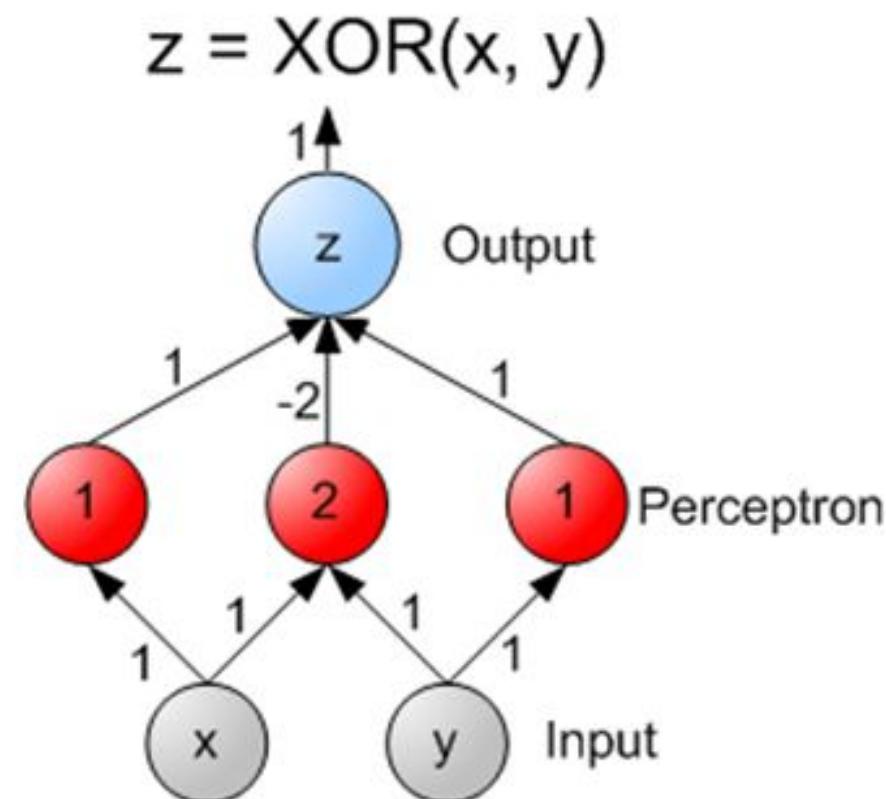

Multi Layer Perceptron(MLP)

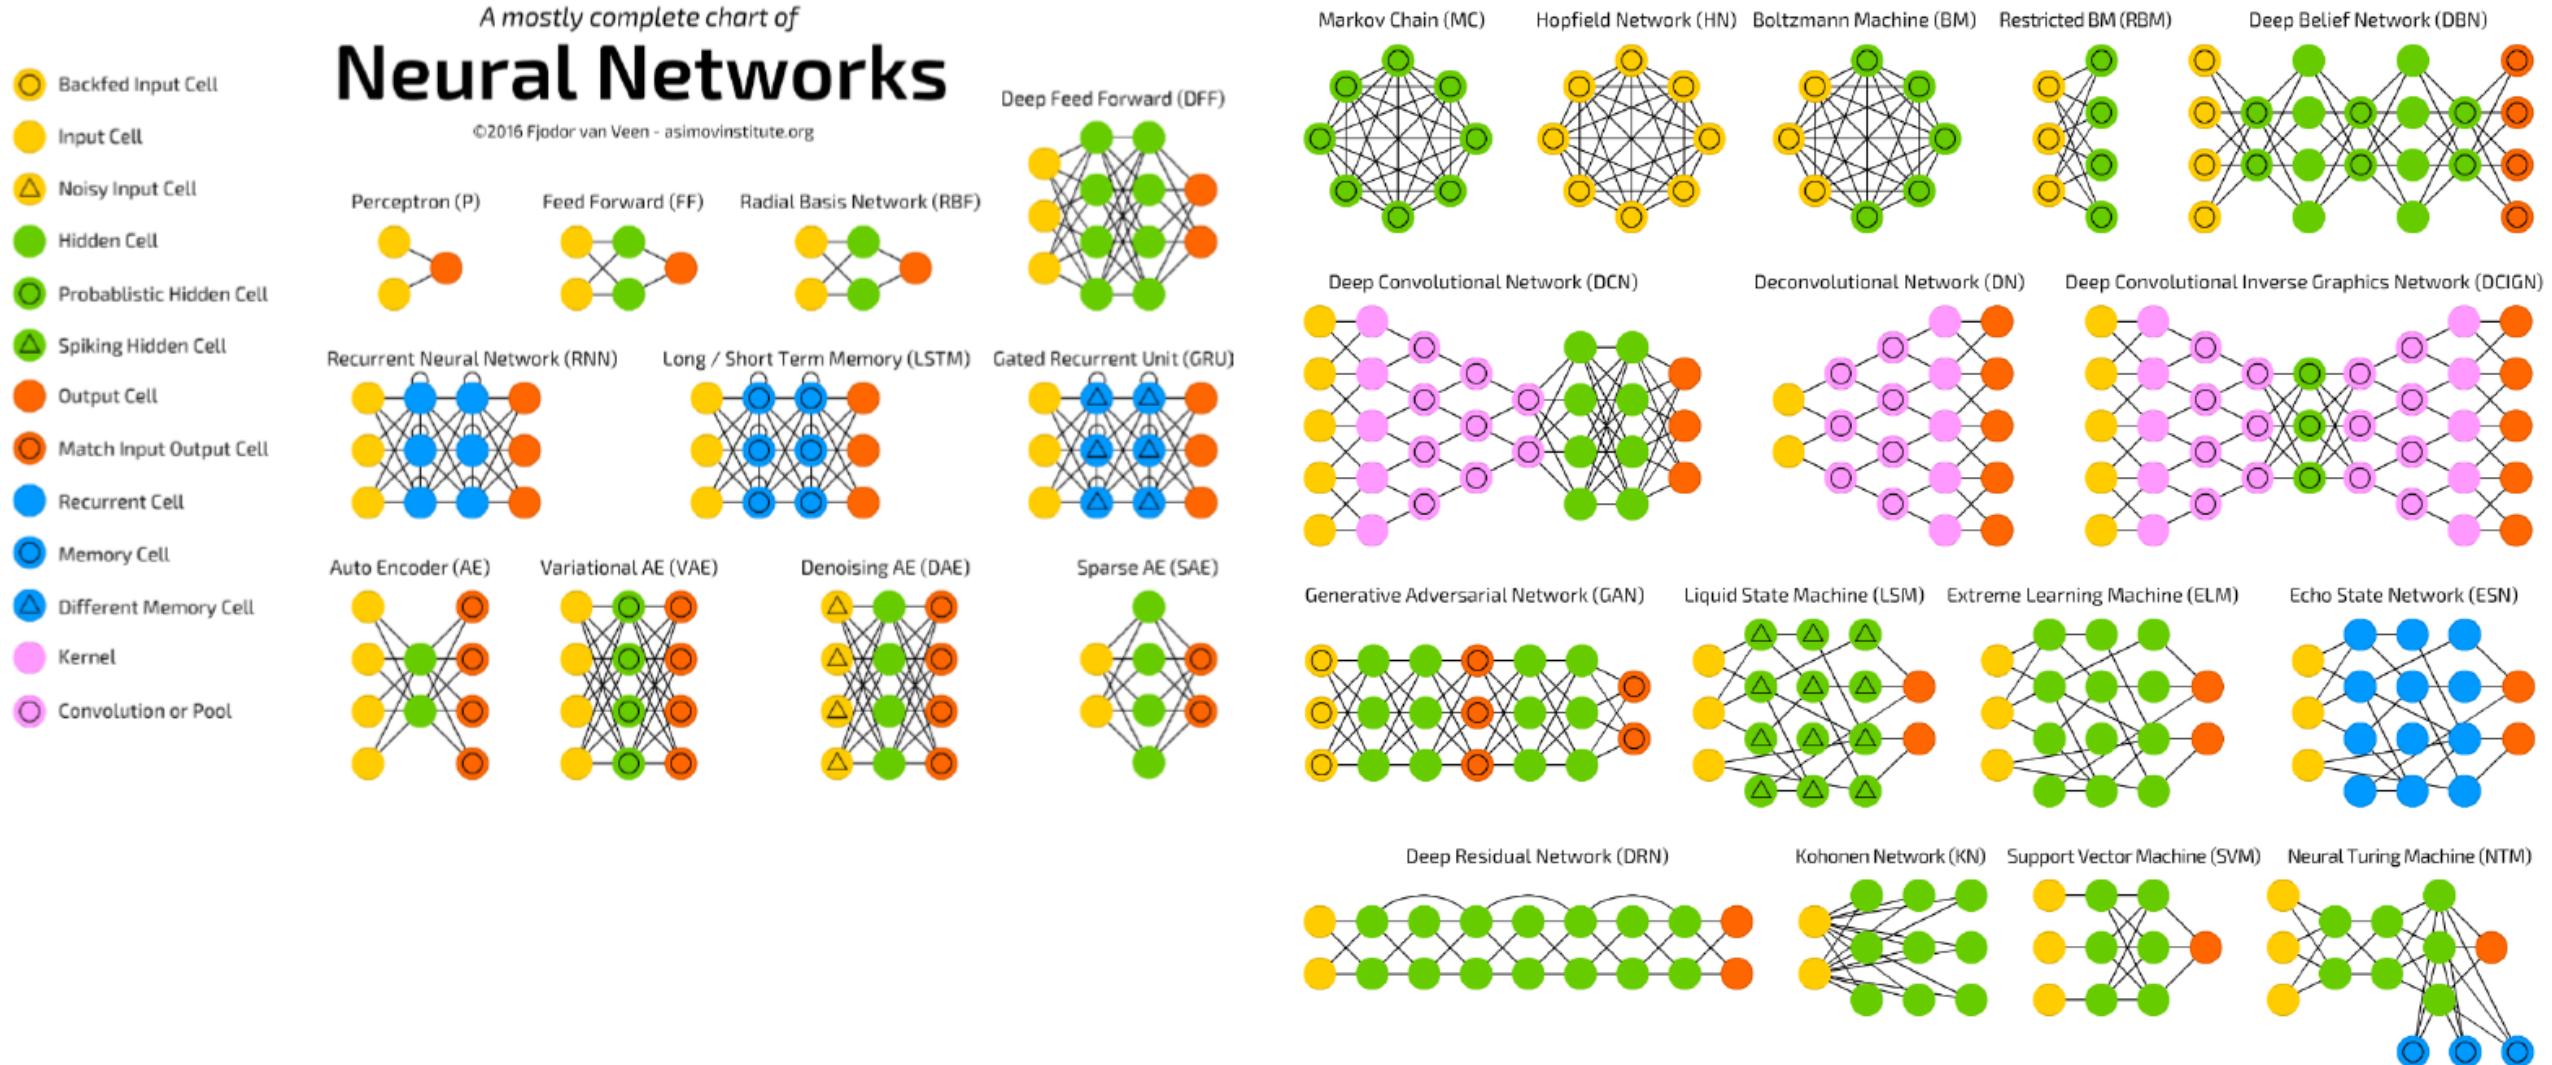

- 아파트 가격 결정에 소득수준이 높은 지역에서는 낮은 지역보다 지하철 역까지의 거리가 덜 중요하다면?
- 아파트 가격을 우선 여러가지로 예측하고 그 예측한 값들을 다시 잘 조합하여 더 잘 예측해보자(regression)
- 선을 잘 긋고 input 공간을 잘 왜곡하고 합하는 과정을 반복해서 데이터들을 잘 구분 해보자(classification)
- 이렇게 perceptron을 여러층으로 쌓으면 더 복잡한 문제를 풀 수 있다
- Linear fitting과 Non-linear transform의 반복

Universal Function Approximation

The universal approximation theorem for neural networks states that every continuous function that maps intervals of real numbers to some output interval of real numbers can be approximated arbitrarily closely by a multi-layer perceptron with just one hidden layer. This result holds only for restricted classes of activation functions, e.g. for the sigmoidal functions.
(Wikipedia.org)

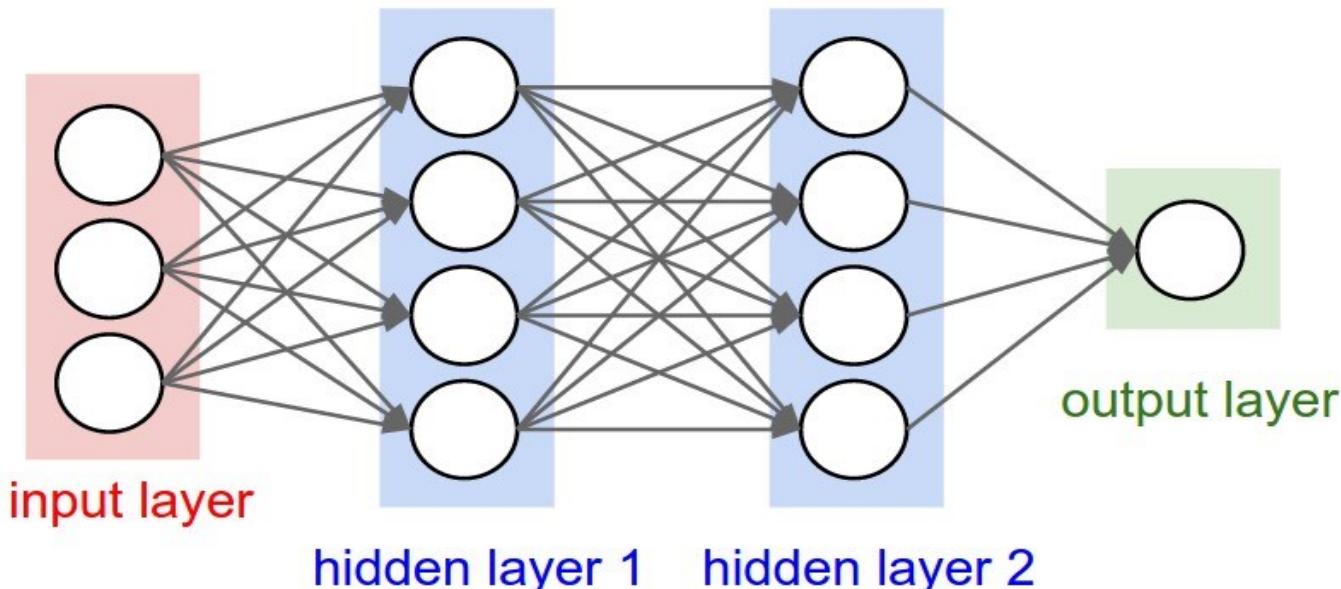

Making Neural Networks

딥러닝(Deep Learning)

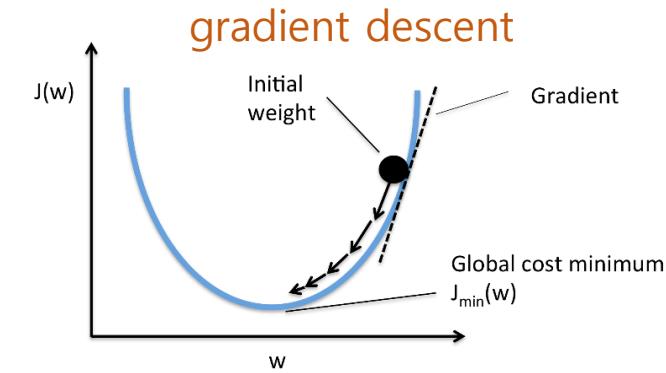

- 딥러닝은 deep neural network를 통하여 학습하는 것을 의미함
- Hidden layer의 수 $\leq 1 \rightarrow$ shallow network
- Hidden layer의 수 $\geq 2 \rightarrow$ deep network

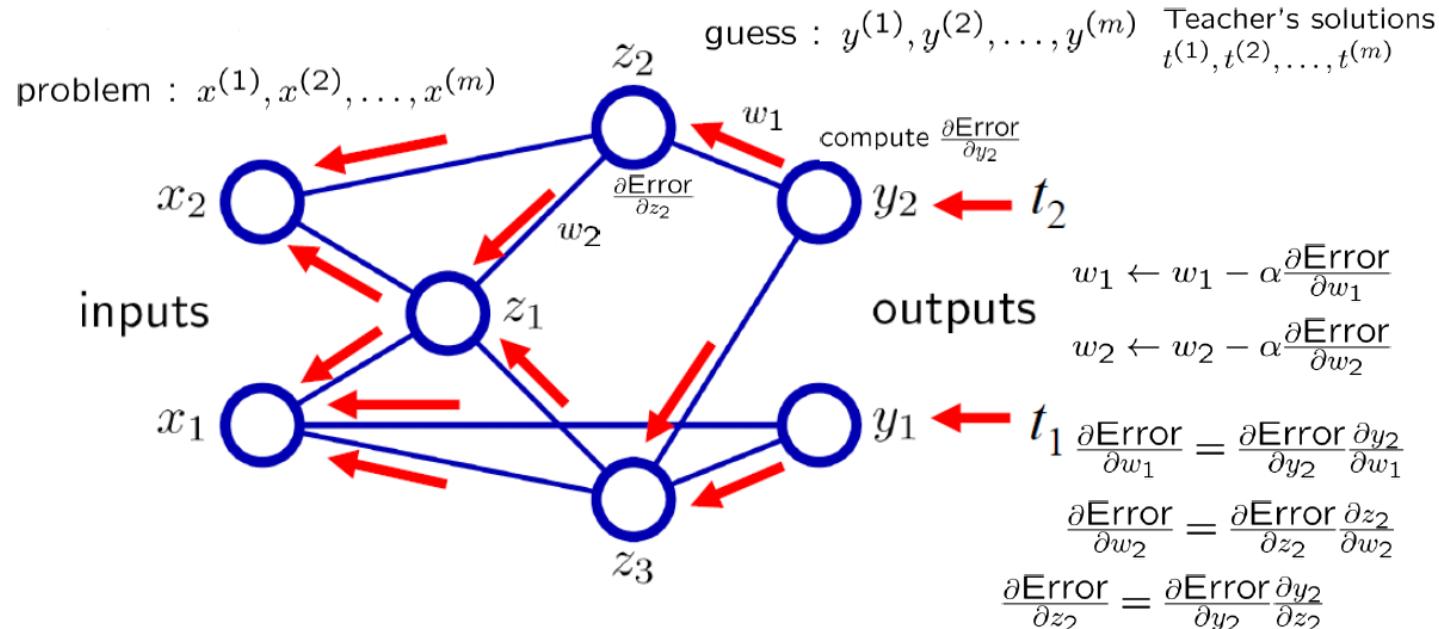

- 이렇게 많은 weight 값들을 어떻게 학습시킬 것인가??

Back Propagation

- 학습과정 : back propagation of error
 - Output layer에서 error(cost)를 계산
 - Error의 미분값을 back propagation
 - 미분값에 α 를 곱한 만큼 w 를 보정(학습!)
 - α 는 learning rate를 의미함

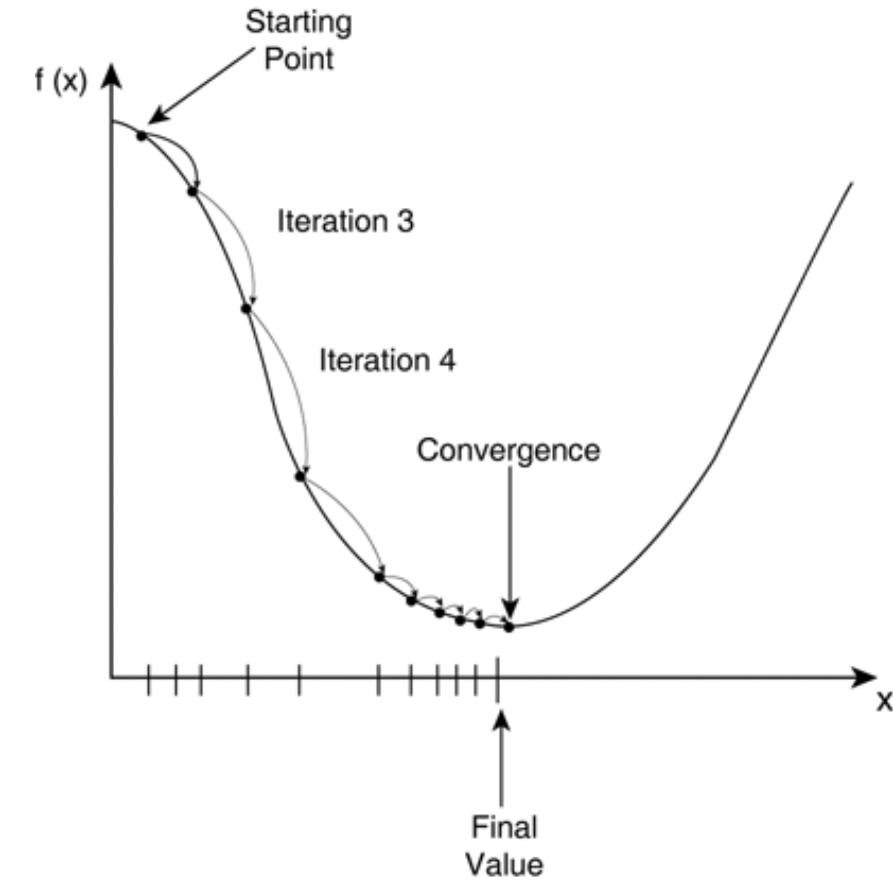

$$\text{minimize Error} = \sum_{l=1}^m (y^{(l)} - t^{(l)})^2$$

Gradient Descent

- Loss Function 을 W (parameter)로 편미분해서 w 에 대한 Gradient를 구한다
- Gradient를 이용해서 w 를 업데이트 한다

$$W^* = W - \alpha \text{Loss}'(W)$$

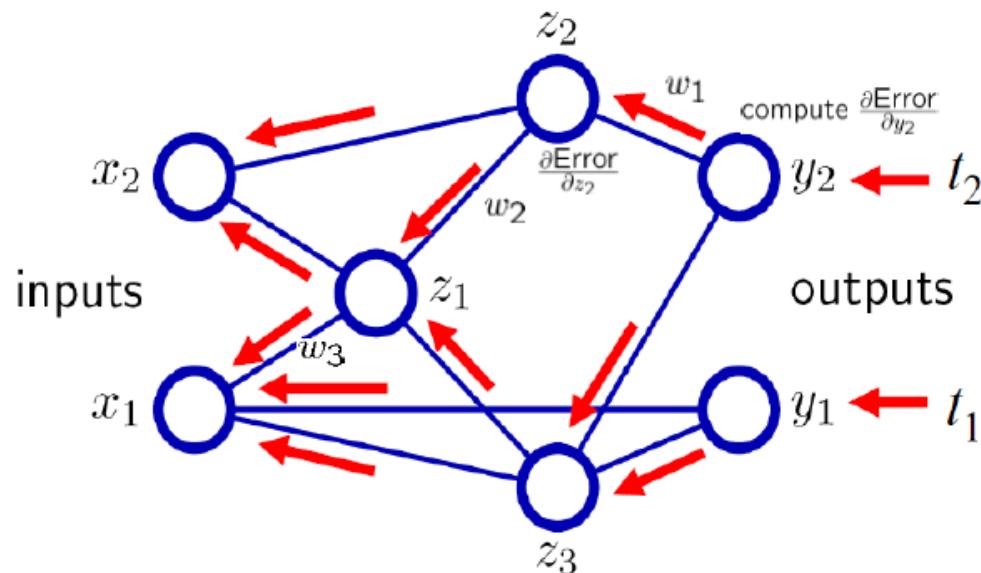

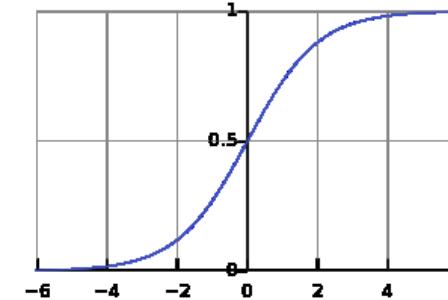

딥러닝을 어렵게 하는 것들

- Vanishing gradient problem
- Overfitting problem
- Get stuck in local minima

Vanishing Gradient Problem

- Gradient 값이 뒤로 전달될 수록 점점 작아짐
- Sigmoid 사용으로 인하여(미분값의 최대 : $\frac{1}{4}$) 아래쪽 layer는 학습이 이루어지지 않음

$$\frac{\partial \text{Error}}{\partial w_1} = \frac{\partial \text{Error}}{\partial y_2} \frac{\partial y_2}{\partial w_1} = \frac{\partial \text{Error}}{\partial y_2} \sigma'(\cdot) z_2$$

$$\frac{\partial y_2}{\partial w_1} = \sigma'(\cdot) z_2$$

$$\frac{\partial \text{Error}}{\partial w_2} = \frac{\partial \text{Error}}{\partial z_2} \frac{\partial z_2}{\partial w_2} = \frac{\partial \text{Error}}{\partial y_2} \sigma'(\cdot) w_1 \sigma'(\cdot) z_1$$

$$\frac{\partial z_2}{\partial w_2} = \sigma'(\cdot) z_1$$

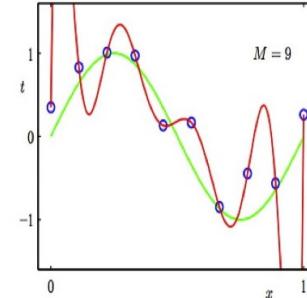

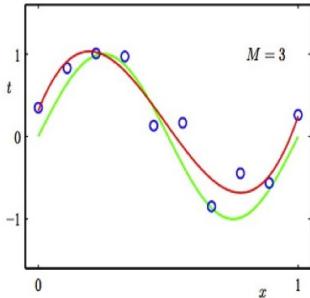

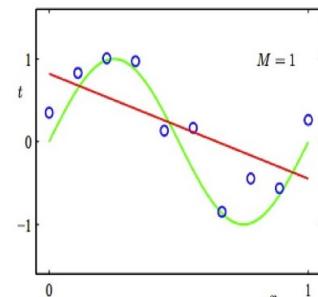

$$\frac{\partial \text{Error}}{\partial w_3} = \sigma'(\cdot) \sigma'(\cdot) \sigma'(\cdot) C$$

$$\sigma'(\cdot) \approx 0$$

Overfitting Problem

- Data가 많지 않은 경우에 발생할 수 있음
- 학습한 data에만 최적화되어서, 학습하지 않은 data(test data)에 대한 추론 성능이 악화되는 현상

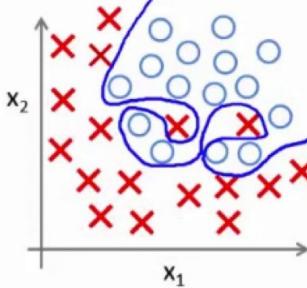

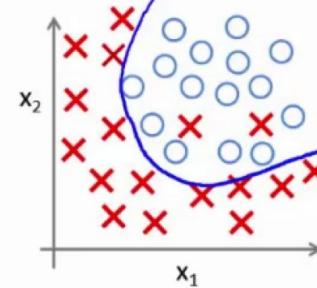

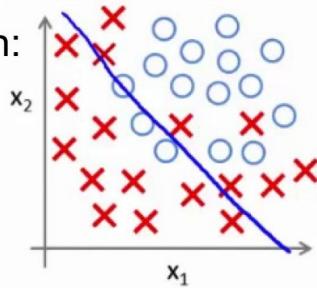

Regression:

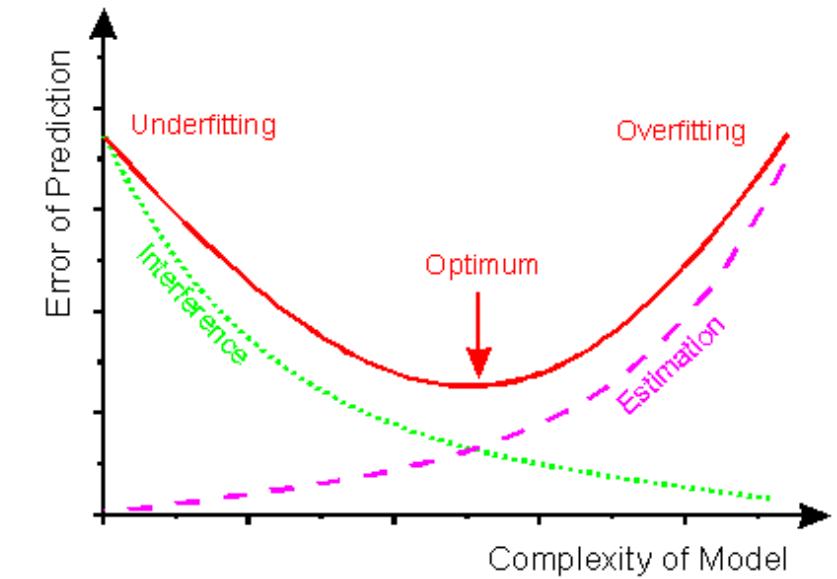

predictor too inflexible:
cannot capture pattern

predictor too flexible:
fits noise in the data

Classification:

Local Minima

- 어디서 시작하느냐에 따라서 잘못하면 local minima에 빠질 위험이 존재

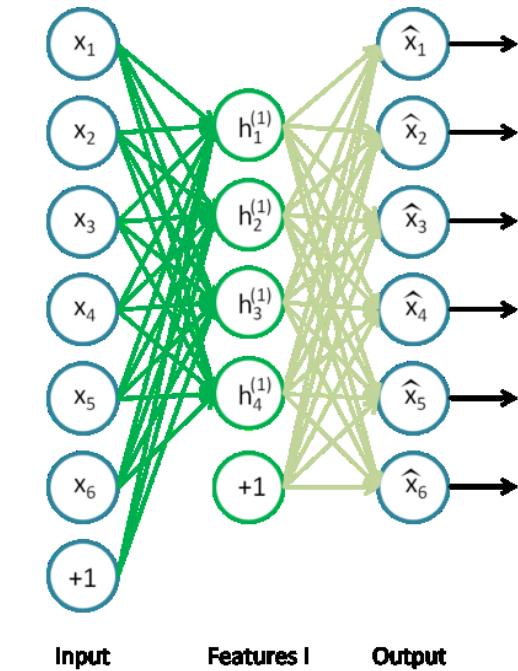

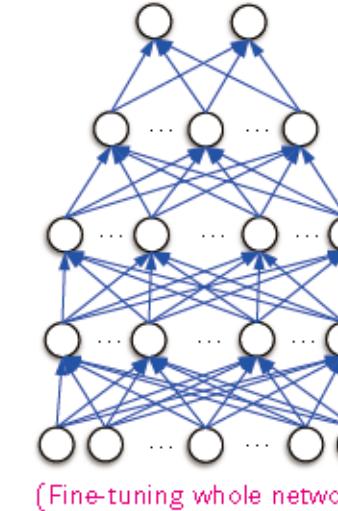

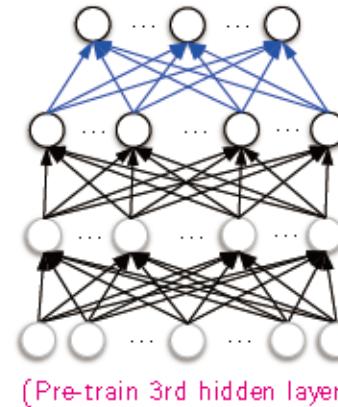

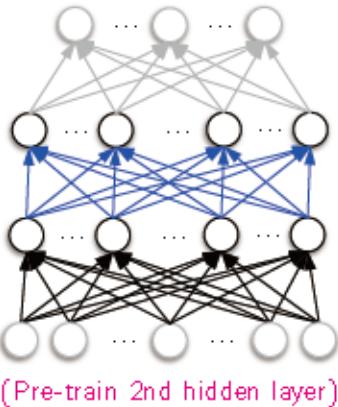

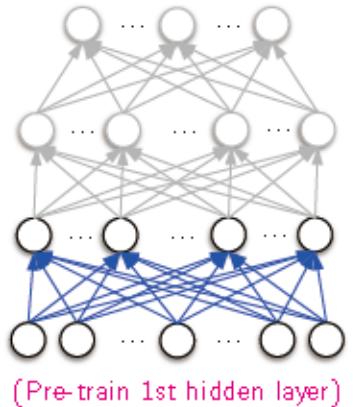

ConvNets: till 2012

Common wisdom: training does not work because we “get stuck in local minima”

Deep Belief Network

- Probabilistic generative model
- Deep architecture – multiple layers (stacks of RBMs)
- Greedy layer-wise training algorithm
- Supervised fine-tuning can be applied

Difficulties of Training DNN

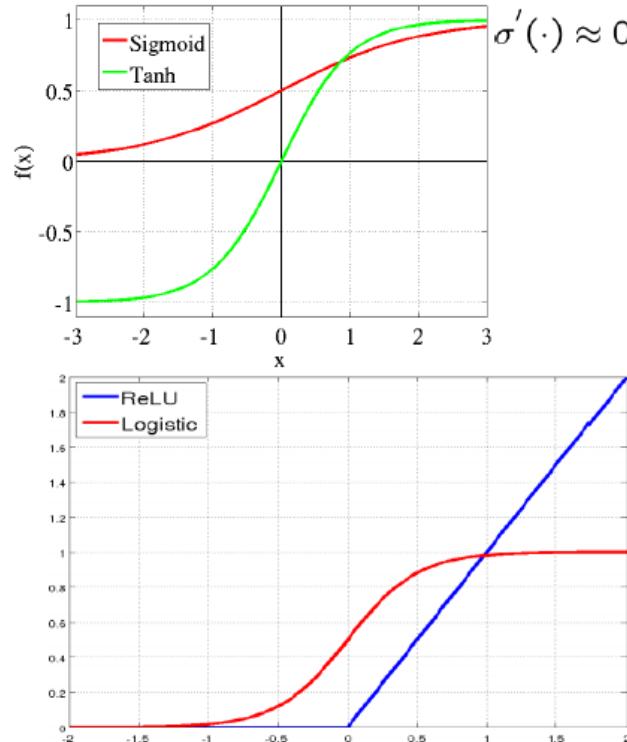

- Vanishing gradient problem
 - Solved by bottom-up layerwise unsupervised pre-training
- Typically requires lots of labeled data
- Overfitting problem
 - Solved by using lots of unlabeled data
- Get stuck in local minima(?)
 - Unsupervised pre-training may help the network initialize with good parameters(?)

새로운 방법들

- Vanishing gradient problem
→ Sigmoid 말고 ReLU를 쓰자
- Overfitting problem
→ Regularization method를 쓰자(예 : dropout)
- Get stuck in local minima
→ Local minima에 빠져도 괜찮다

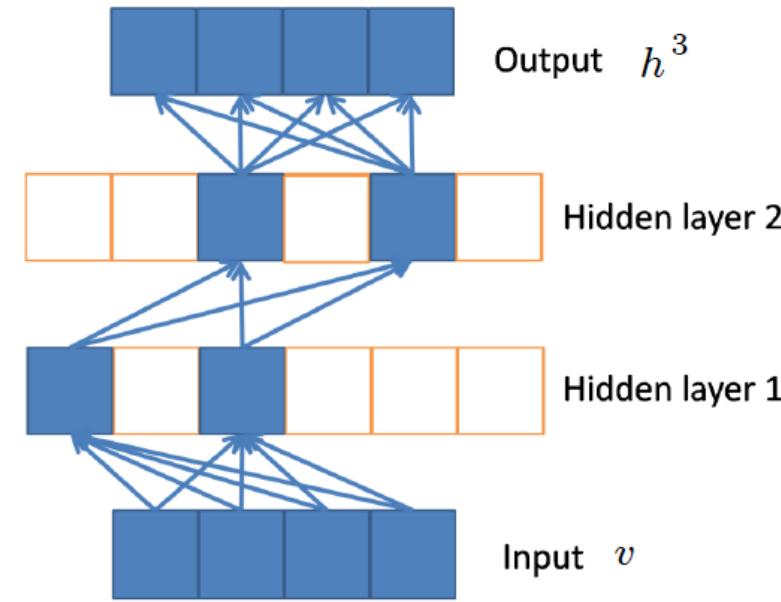

ReLU : Rectified Linear Unit

- ReLU를 activation function으로 사용 → sparse activation
- ReLU는 미분값이 0 아니면 1 → vanishing gradient 해결

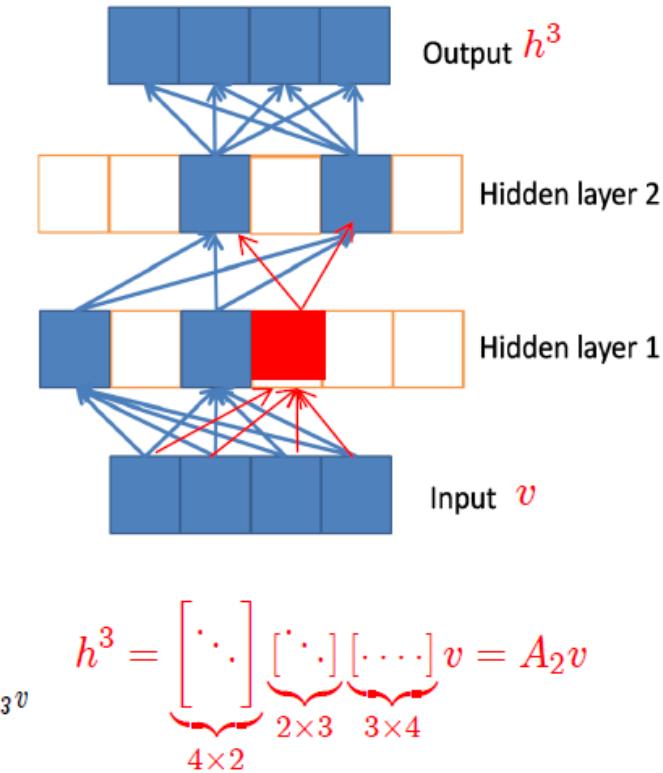

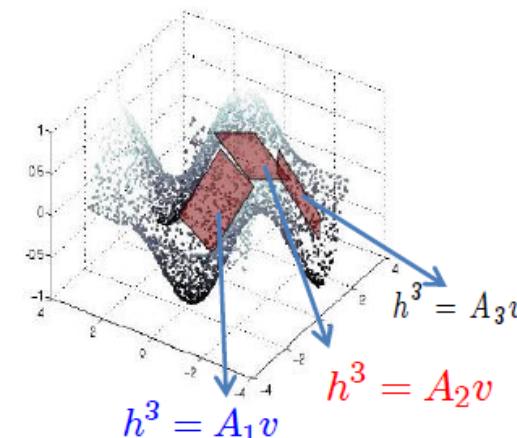

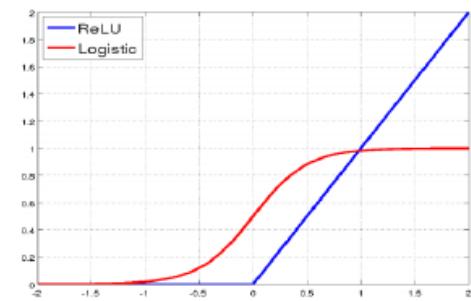

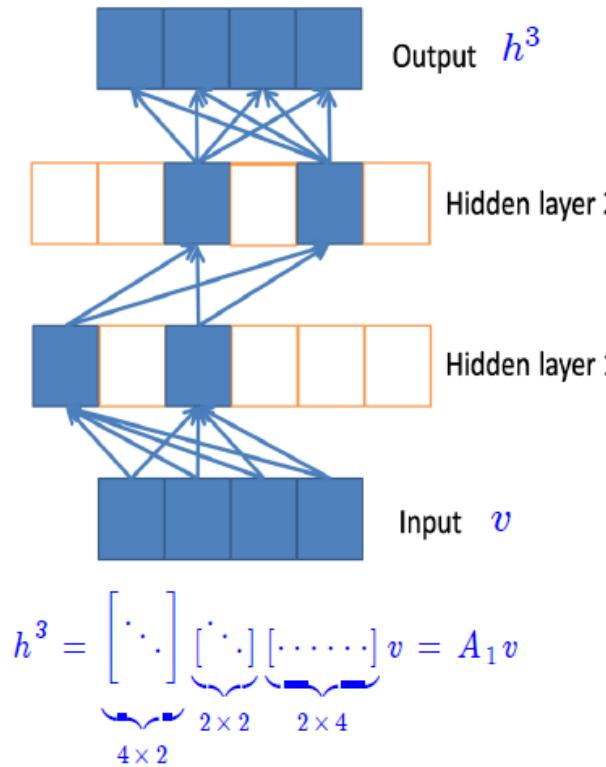

$$f(x) = \begin{cases} x & x \geq 0 \\ 0 & x < 0 \end{cases}$$

slope: 1

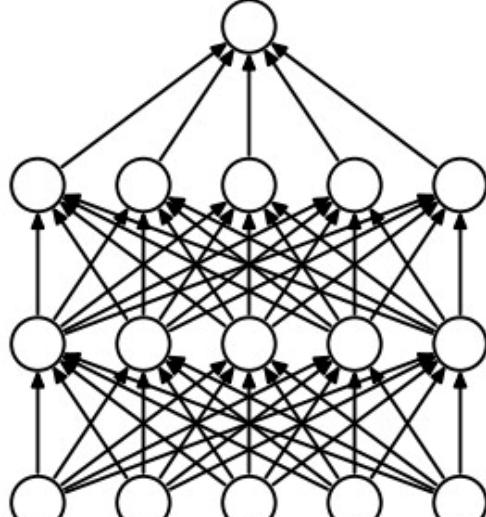

ReLU의 의미

- Piece-wise linear tiling : locally linear mapping

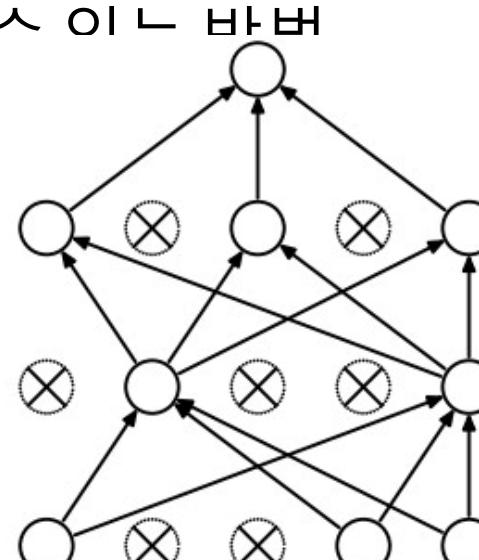

Dropout(Regularization Method)

- 각 학습 단계마다, 특정 확률로(예 : 50%) random하게 hidden layer에 있는 unit들을 없애고 학습하는 방법
- Ensemble 개념을 적용
 - 여러 개의 model을 사용하여 평균값을 쓰면 하나의 model을 쓰는 경우보다 좋음
 - 하나의 model을 여러 번 실행하는 대신 하나의 model을 여러 번 실행하는 경우보다 좋음

(a) Standard Neural Net

(b) After applying dropout.

Other Regularization Methods

- Weight Decay(L2 Regularization)

$$E(w) = E_0(w) + \frac{1}{2} \lambda \sum_i w_i^2$$

- Batch Normalization

- Benefits of BN

- Increase learning rate
 - Remove dropout
 - Reduce L2 weight decay
 - Remove LRN

Input: Values of x over a mini-batch: $\mathcal{B} = \{x_{1\dots m}\}$;

Parameters to be learned: γ, β

Output: $\{y_i = \text{BN}_{\gamma, \beta}(x_i)\}$

$$\mu_{\mathcal{B}} \leftarrow \frac{1}{m} \sum_{i=1}^m x_i \quad // \text{mini-batch mean}$$

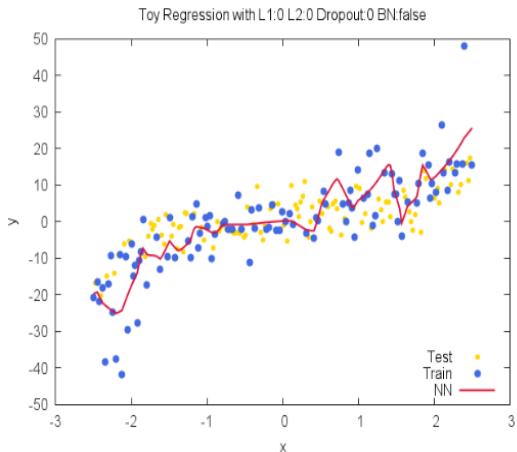

$$\sigma_{\mathcal{B}}^2 \leftarrow \frac{1}{m} \sum_{i=1}^m (x_i - \mu_{\mathcal{B}})^2 \quad // \text{mini-batch variance}$$

$$\hat{x}_i \leftarrow \frac{x_i - \mu_{\mathcal{B}}}{\sqrt{\sigma_{\mathcal{B}}^2 + \epsilon}} \quad // \text{normalize}$$

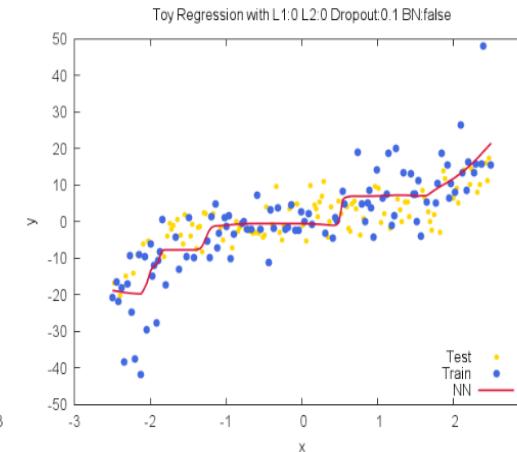

$$y_i \leftarrow \gamma \hat{x}_i + \beta \equiv \text{BN}_{\gamma, \beta}(x_i) \quad // \text{scale and shift}$$

Regularization Methods

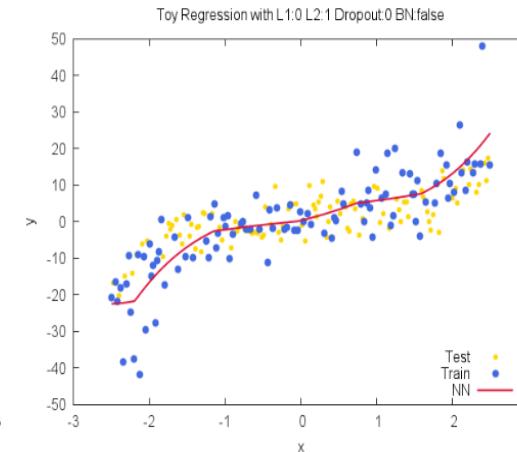

No Regularization

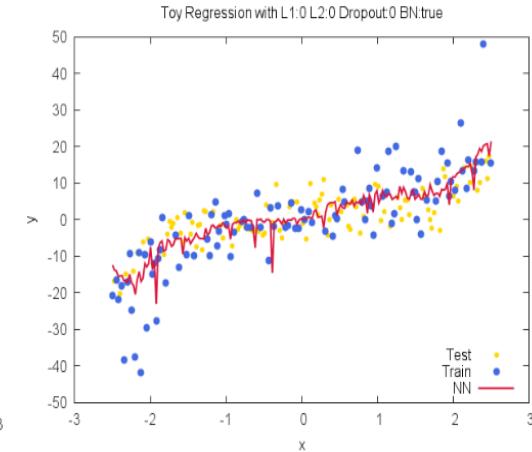

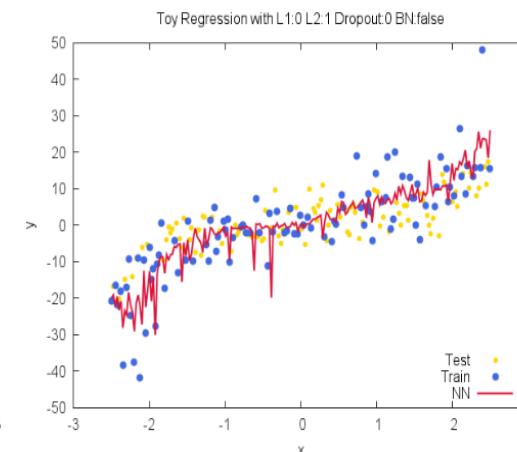

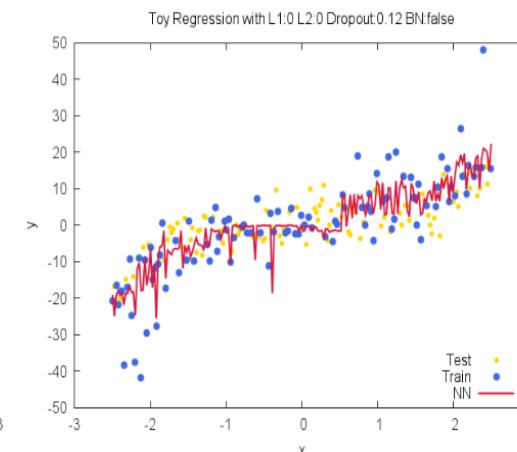

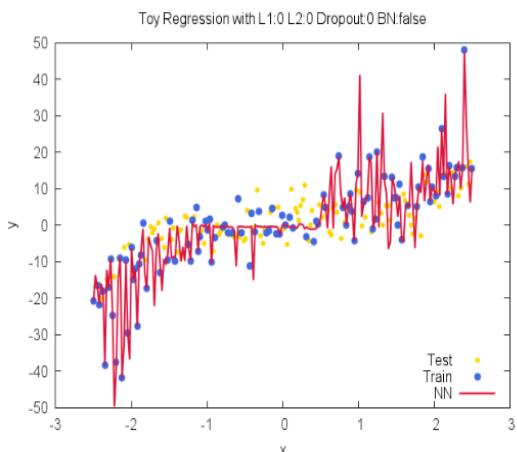

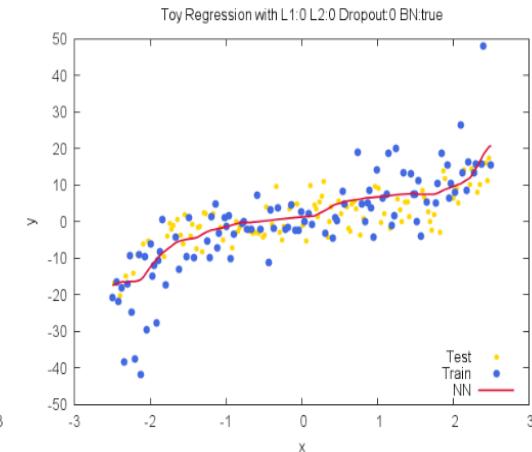

Dropout

L2 Regularization

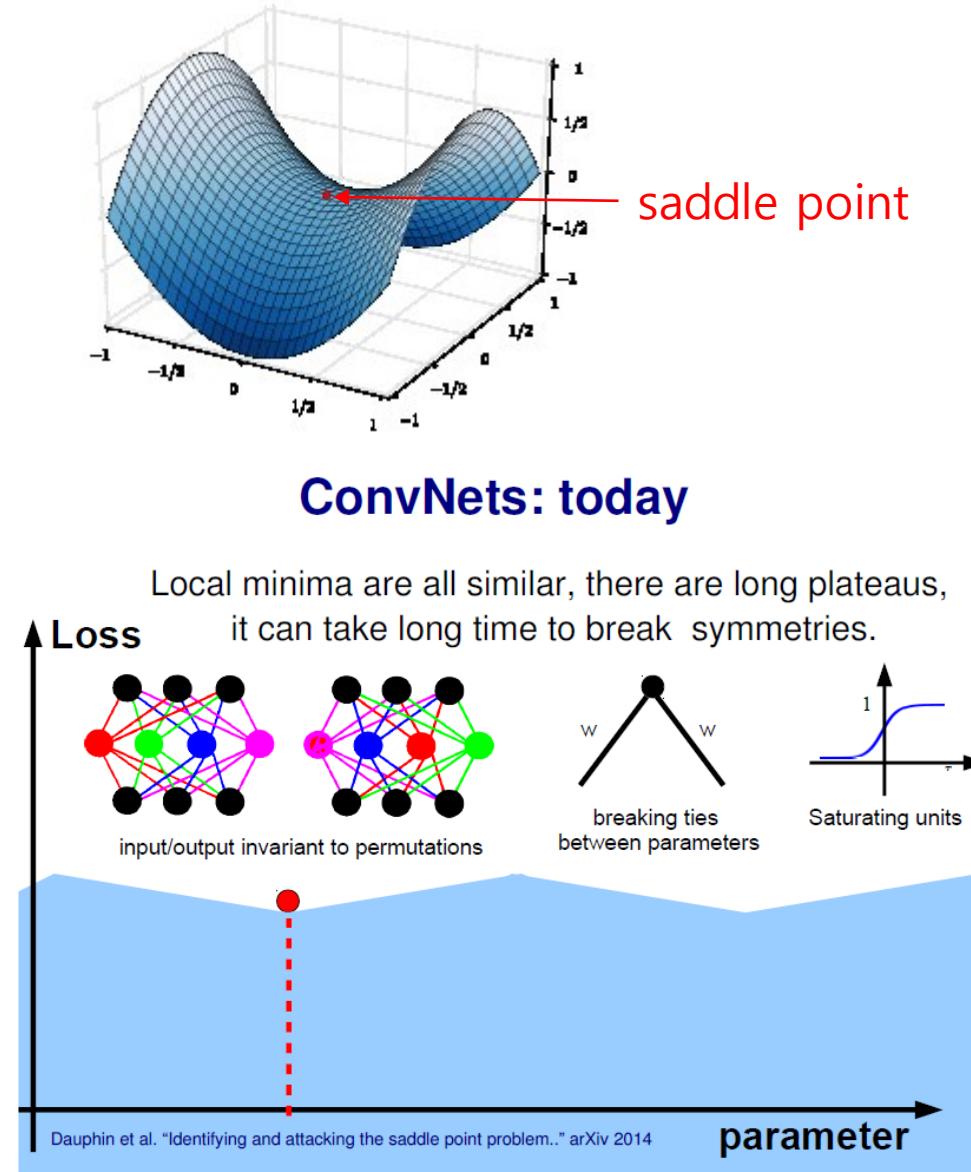

Batch Normalization

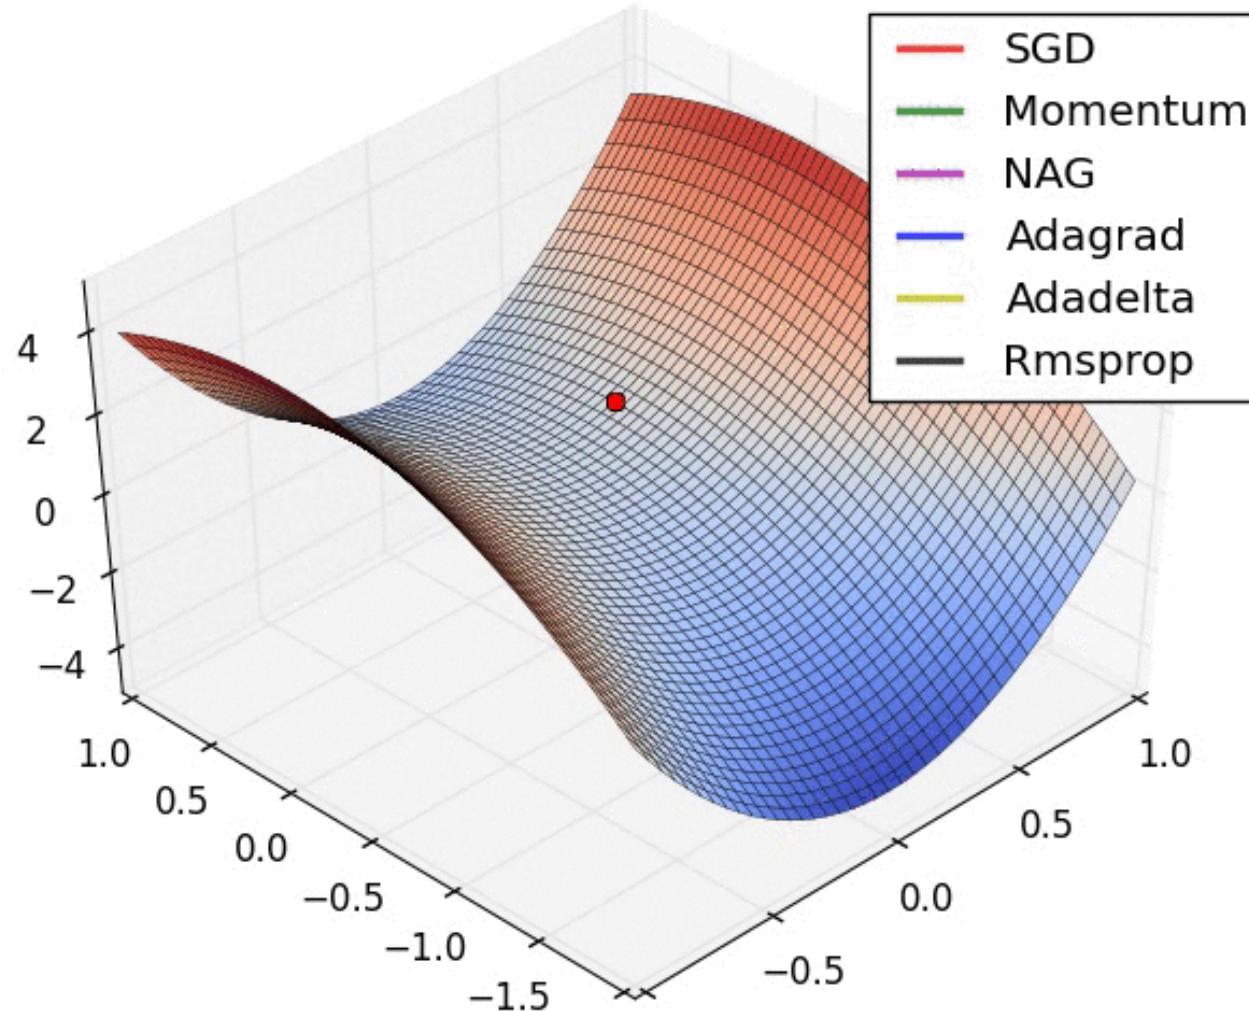

Local Minima에 대하여

- minimum이라고 하는 것은 현재 차원에서 이동할 수 있는 모든 방향으로의 gradient 값이 증가하는 방향이어야 하는데 이런 경우는 확률적으로 희박함
- DNN과 같은 고차원 구조에서는 대부분은 local minima가 아니라 saddle point일 가능성이 높음
- 만약 실제 local minima가 존재한다면 그것은 global minimum과 거의 차이가 없을 가능성이 높음(neural network의 대칭성)

Optimization Methods

그 밖에 Deep Learning을 가능하게 했던 것들

- Hardware
 - CPUs, GPUs!, ASICs
- Organized Large Datasets
 - ImageNet
- Algorithms and Research
 - Backprop, CNN, LSTM
- Software and Infrastructure
 - Git, AWS, Amazon Mechanical Turk, TensorFlow, ...
- Financial Backing of large Companies
 - Google, Facebook, Amazon, ...

어떻게 시작할까?

- Data 준비
- Data를 2 or 3가지로 나눔
 - Training set, Test set
 - Training set, Validation set, Test set
- 어떤 모델(알고리즘)을 사용할 것인지 결정
 - 원하는 output의 형태에 따라
 - Data의 종류와 특성에 따라
- Training → Tuning(validation) → Test

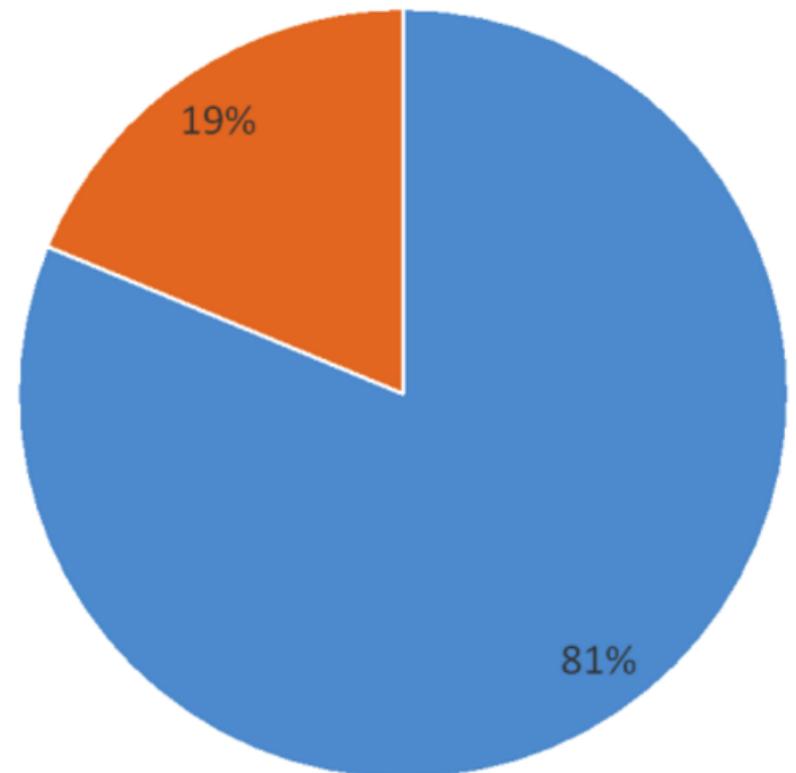

Validation Dataset

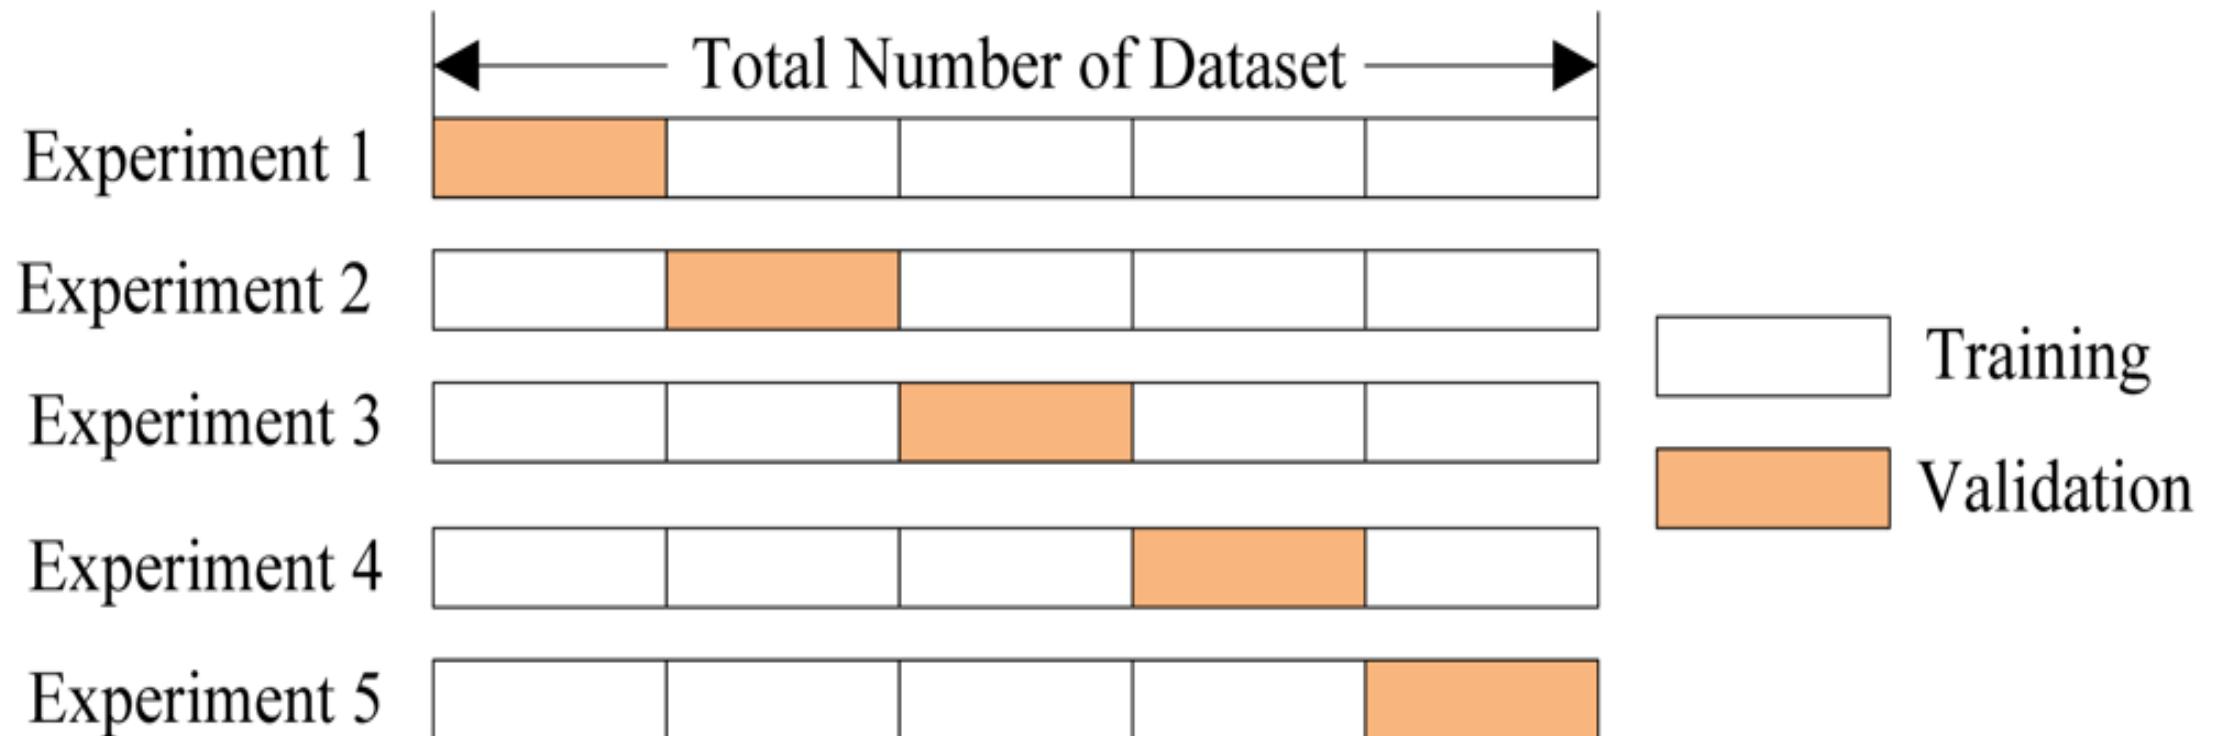

- Problems

- 모든 data를 학습에 사용하지 못함
- 해당 split에만 운좋게 잘할 수 있음(overfitting)

Percentage Split

Cross-Validation

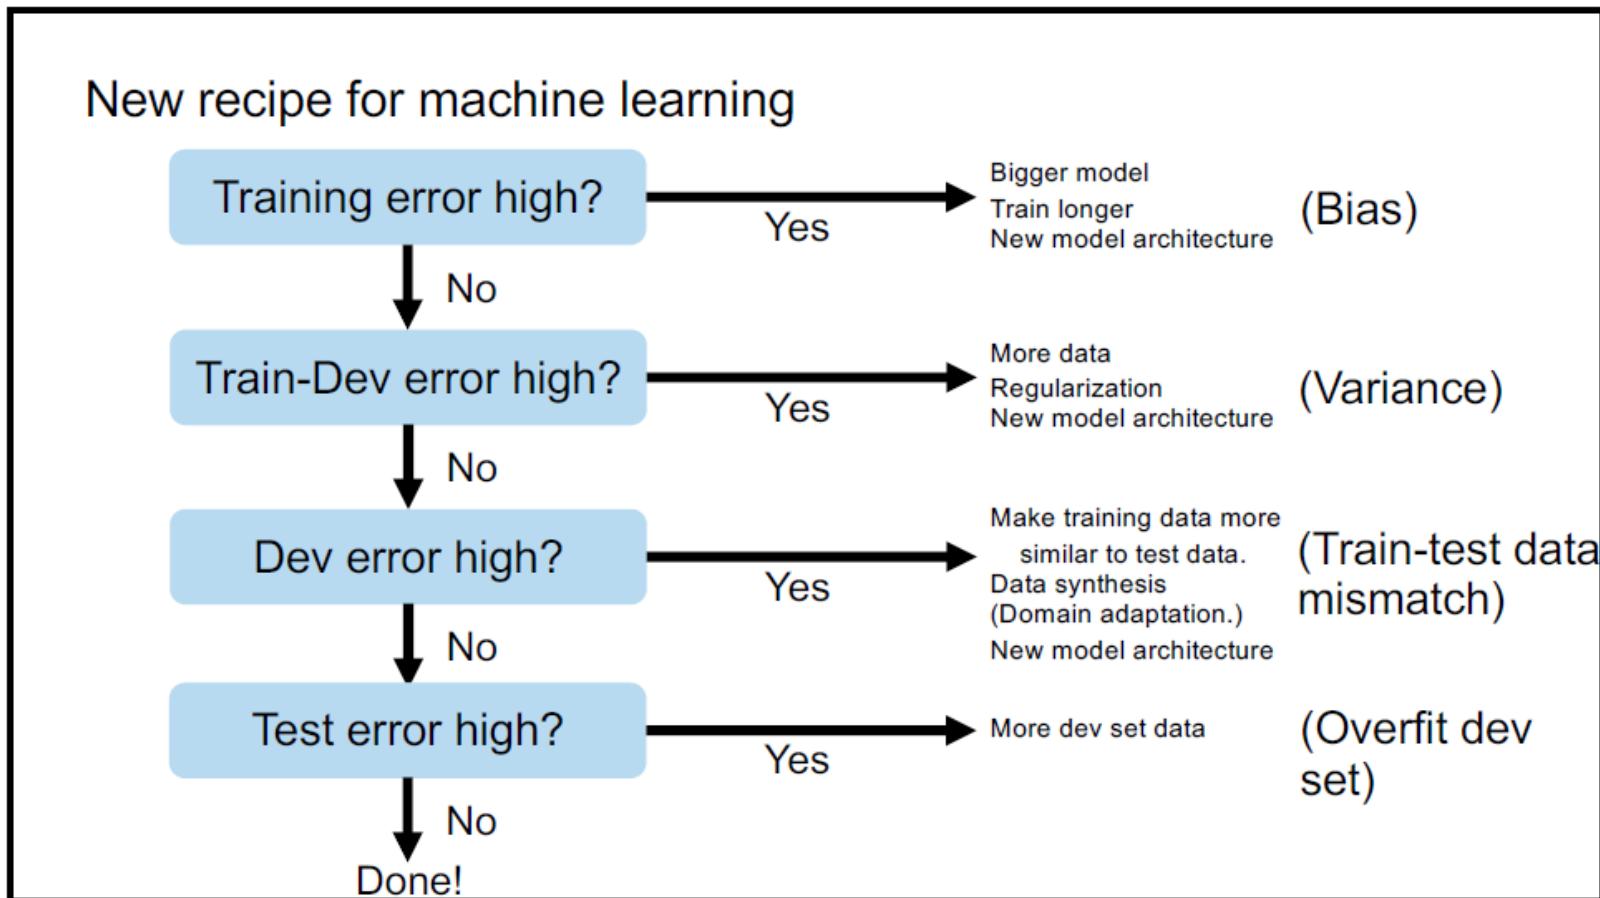

Realistic Problems

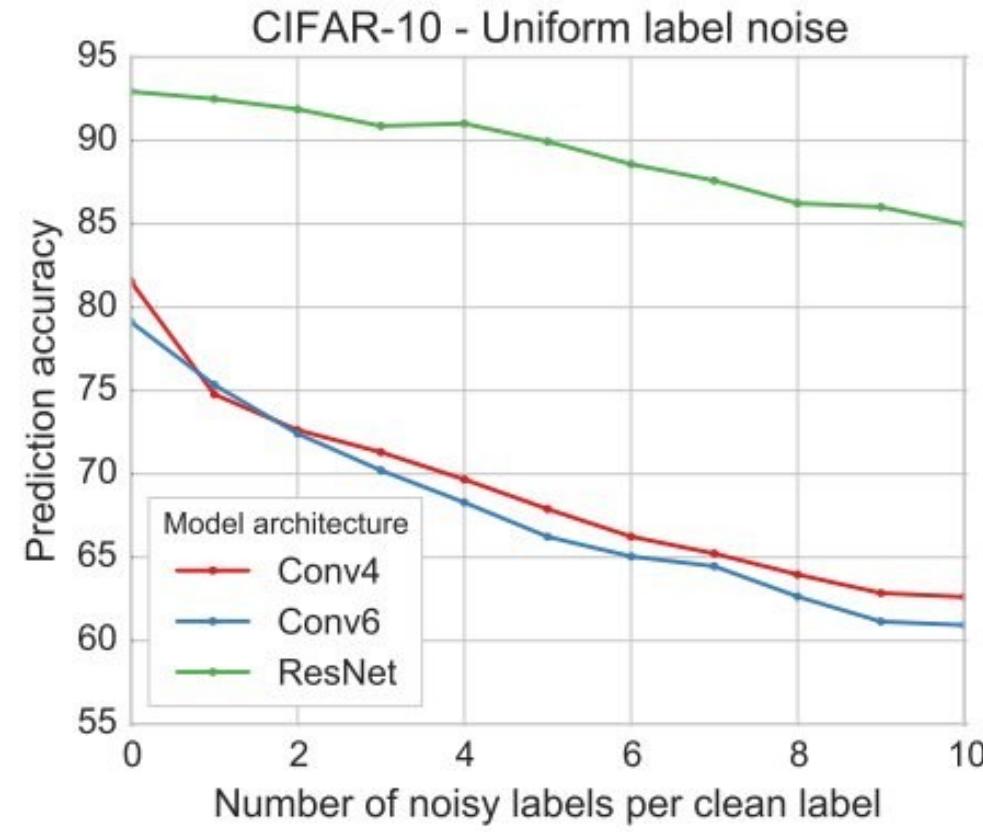

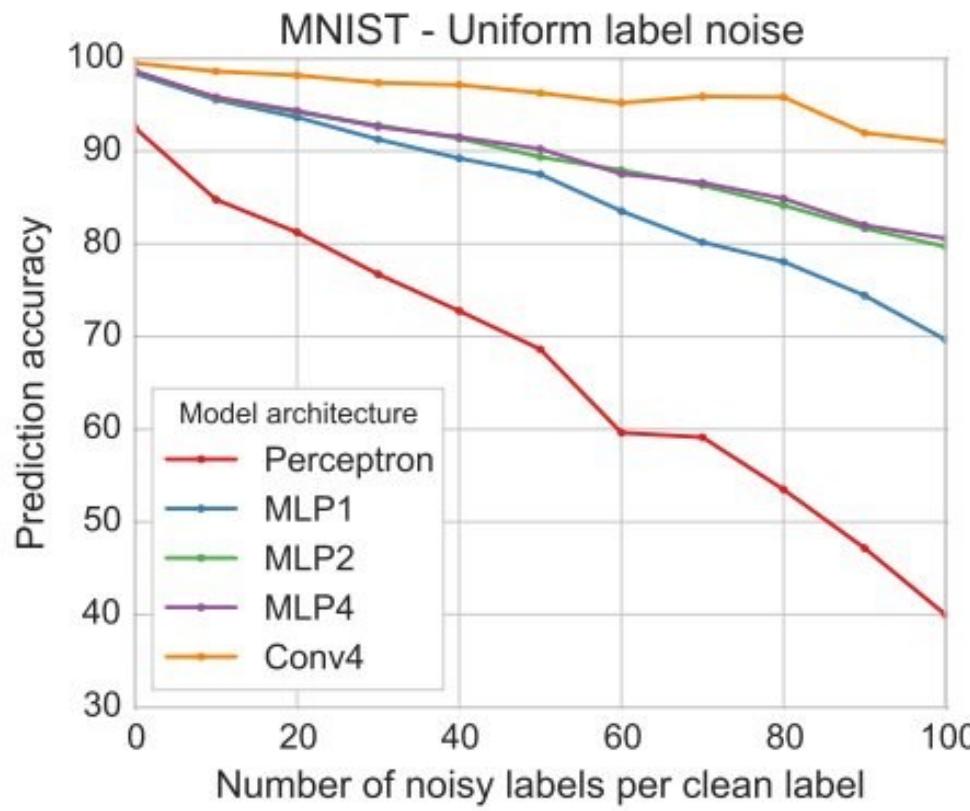

- Data
- Measurement
- Result Interpretation

Data

- Data, more data (by Andrew Ng's tutorial @NIPS 2016)

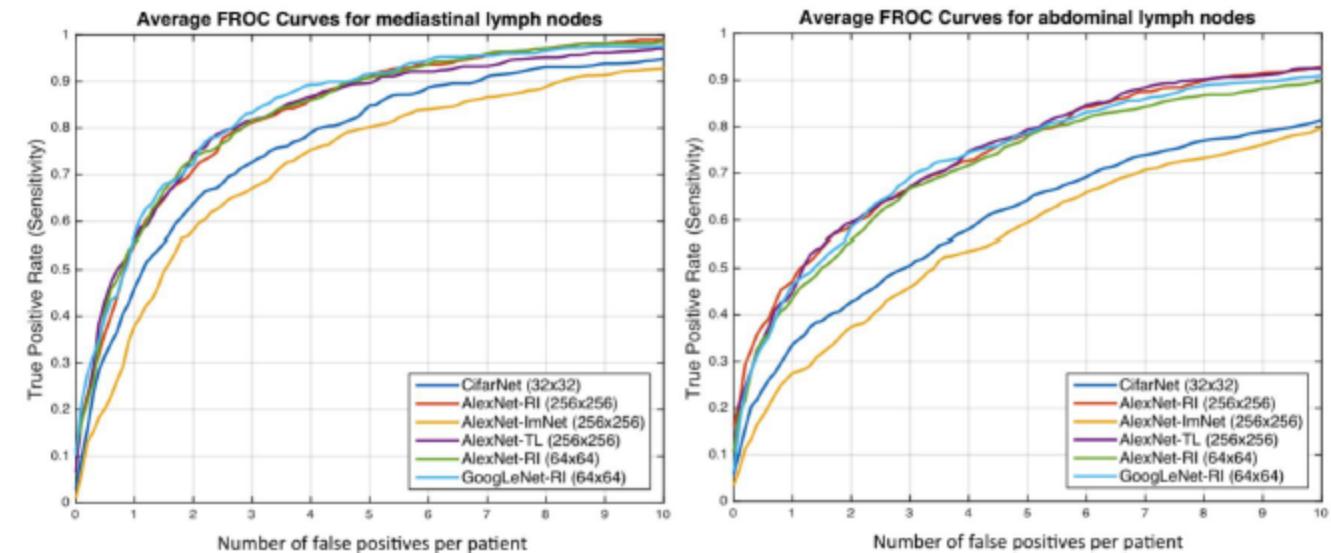

Data is Powerful

If We Don't Have Enough Data

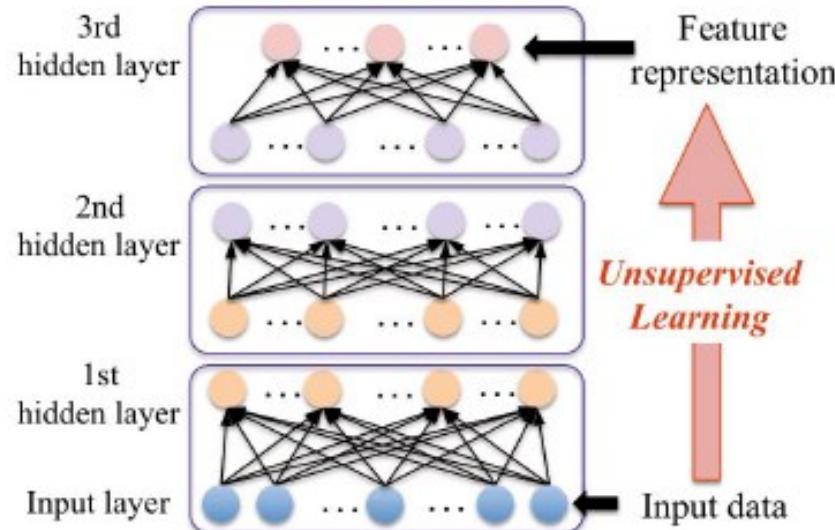

- Use pre-trained model!
- Transfer learning from other domains
 - Transferred network with 'deep' fine-tuning shows good results

Region	Mediastinum		Abdomen	
Method	AUC	TPR/3FP	AUC	TPR/3FP
[41]	-	0.63	-	0.70
[22]	0.92	0.70	0.94	0.83
[36]	-	0.78	-	0.78
CifarNet	0.91	0.70	0.81	0.44
AlexNet-ImNet	0.89	0.63	0.80	0.41
AlexNet-RI-H	0.94	0.79	0.92	0.67
AlexNet-TL-H	0.94	0.81	0.92	0.69
GoogLeNet-RI-H	0.85	0.61	0.80	0.48
GoogLeNet-TL-H	0.94	0.81	0.92	0.70

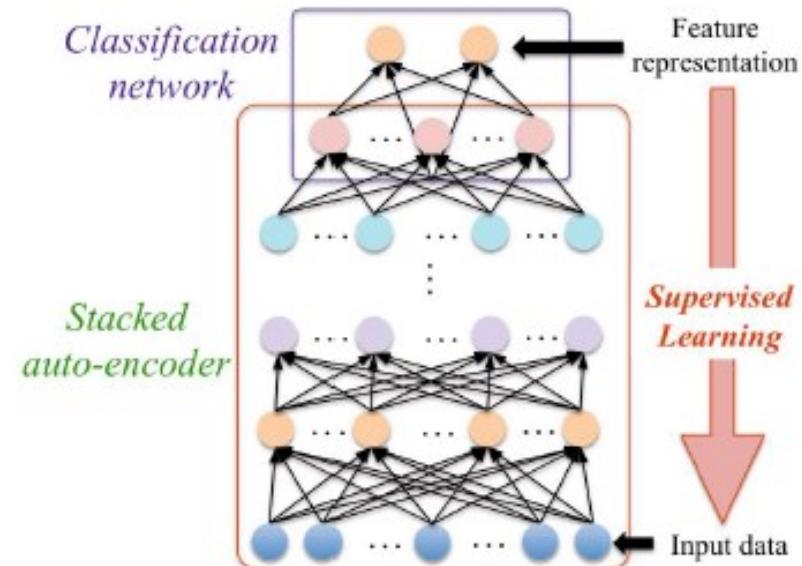

If We Don't Have Enough Data

- Unsupervised pre-training and supervised Fine-tuning
 - Unsupervised training of unlabeled data(using auto-encoder) before supervised learning can make good results

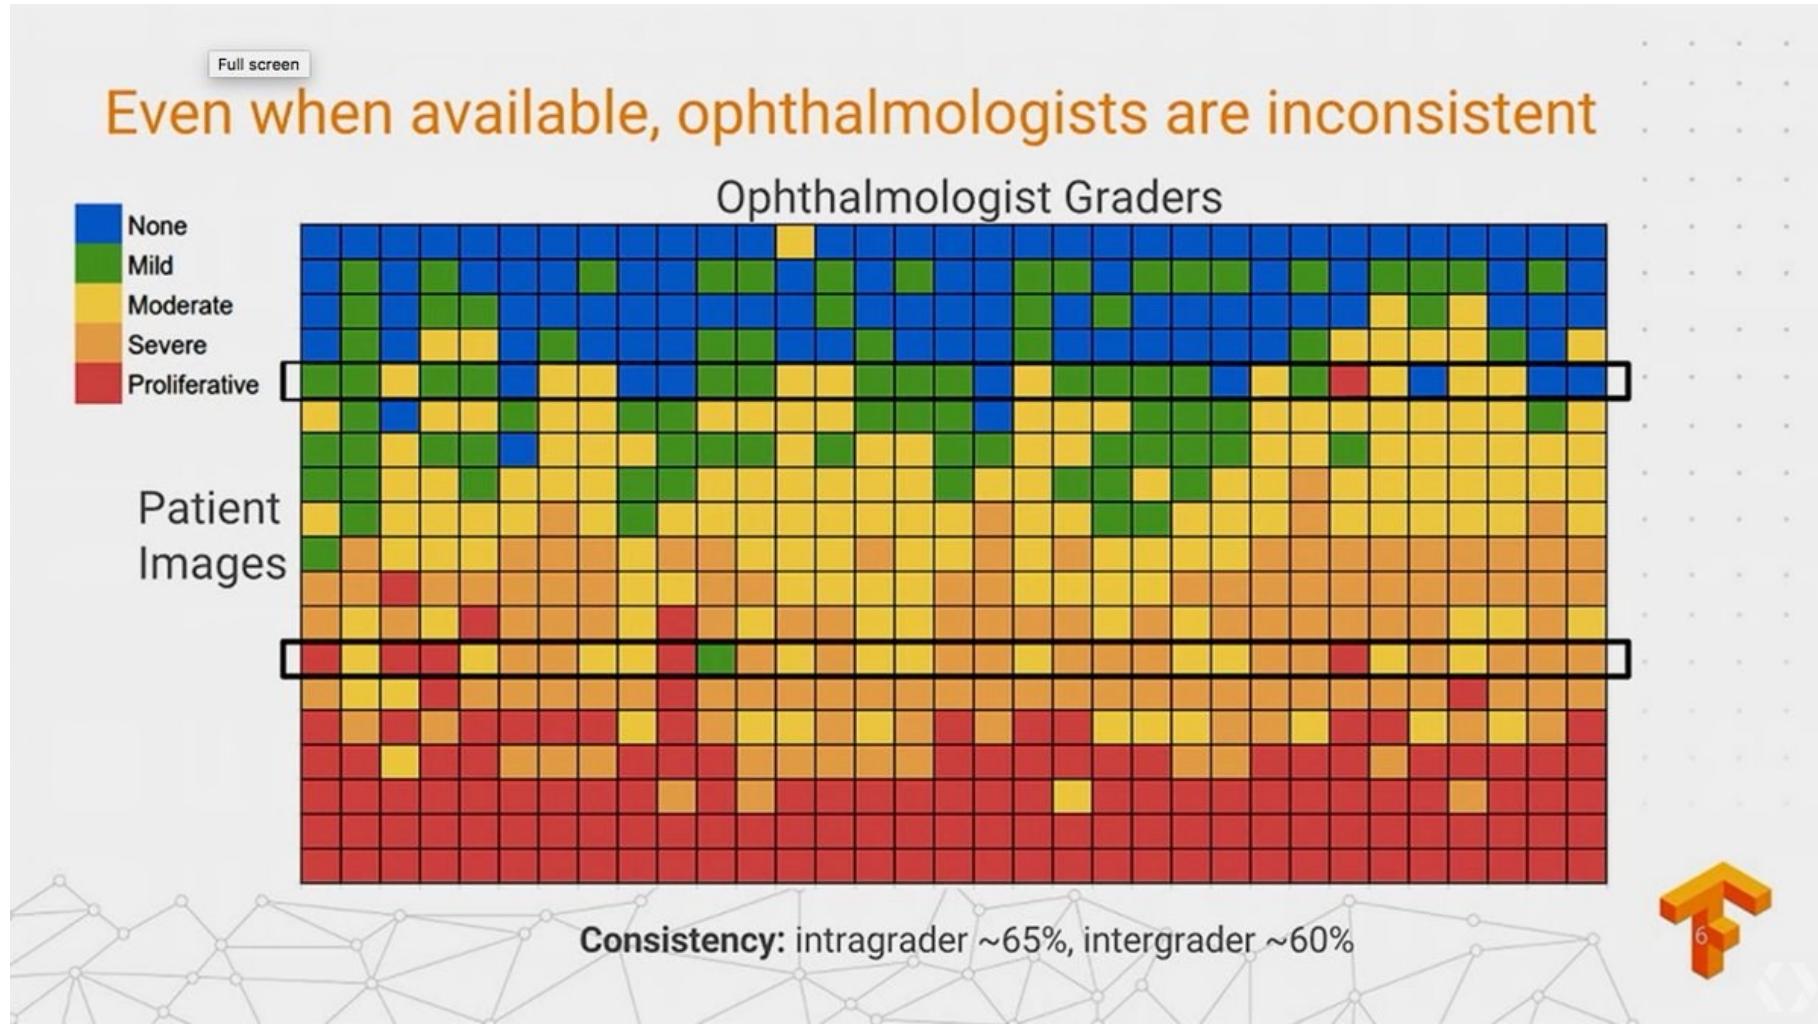

(a) Unsupervised pre-training

(b) Supervised fine-tuning

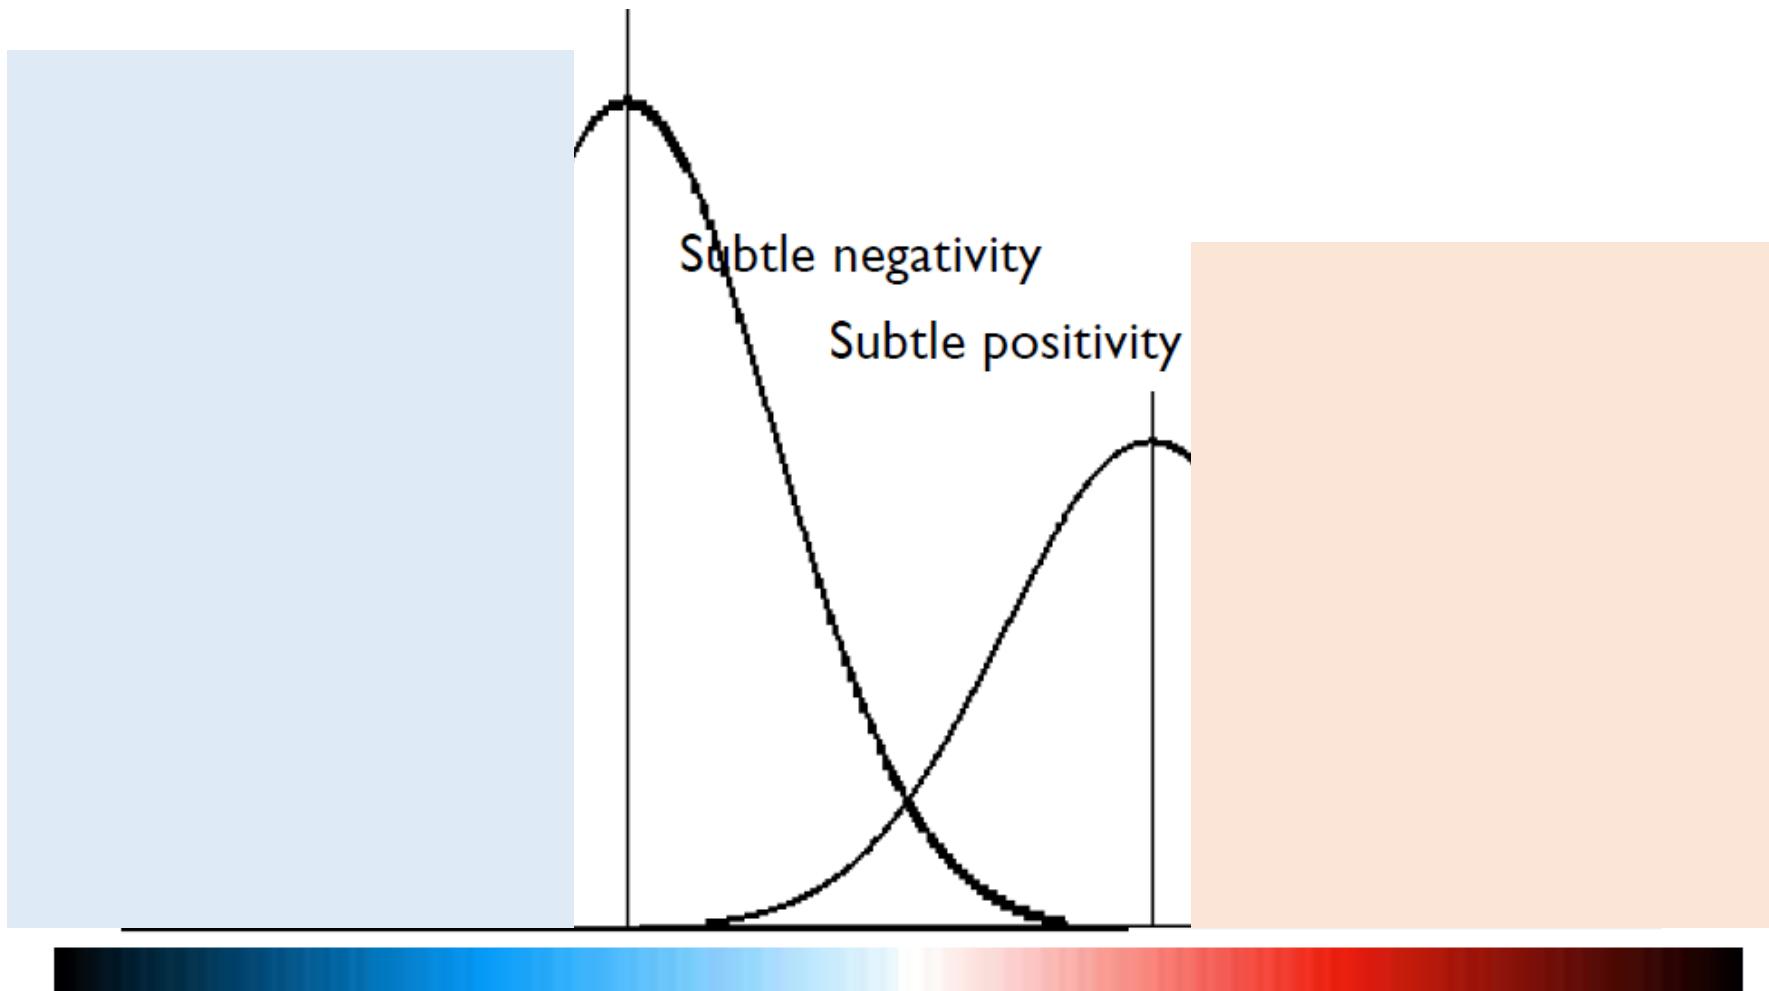

Good Data vs Bad Data

- Our labels are perfect?

Good Data vs Bad Data

- Our data is unbiased?

Is Our Model Good Enough?

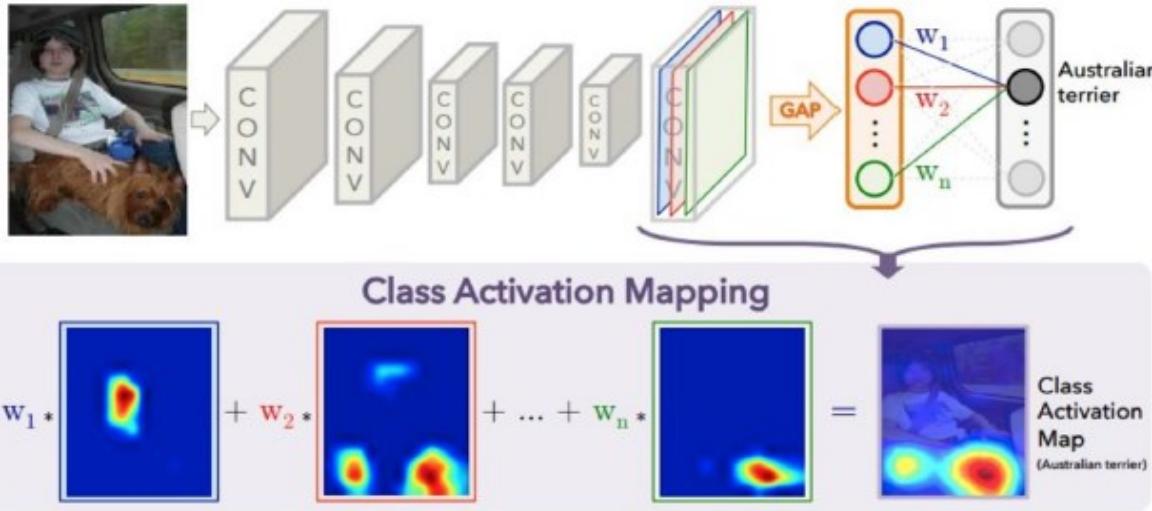

- Sometimes accuracy is not a good measurement

		Predicted class	
		P	N
Actual Class	P	True Positives (TP)	False Negatives (FN)
	N	False Positives (FP)	True Negatives (TN)

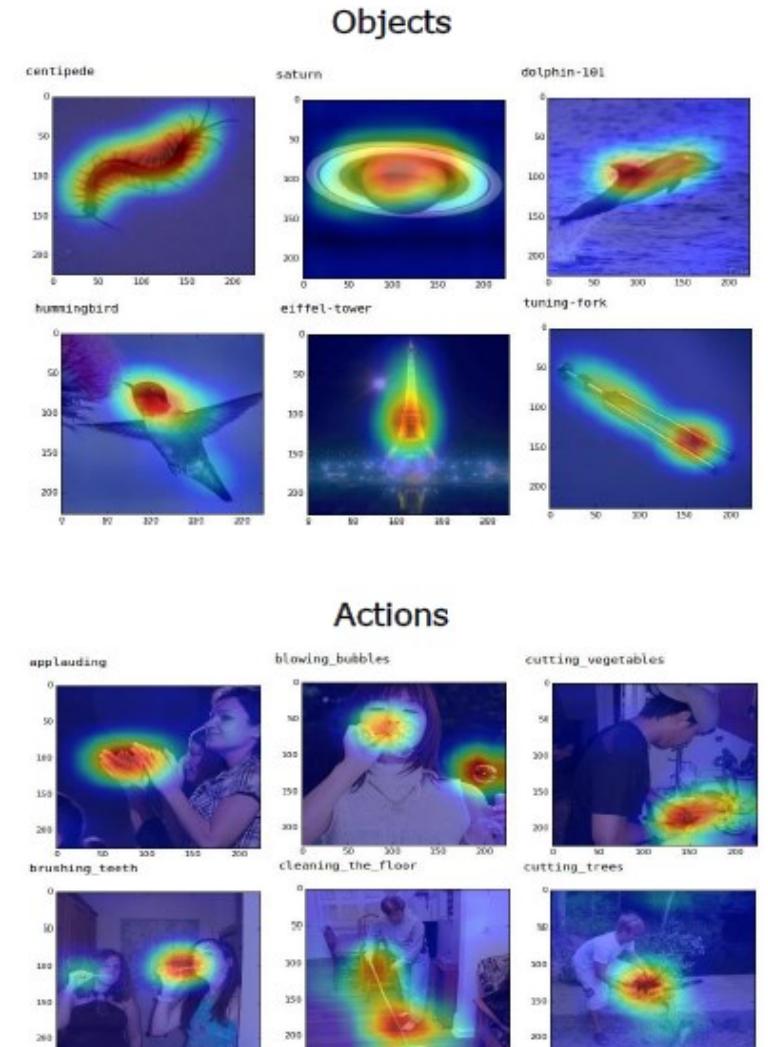

Sensitivity
Recall

Precision

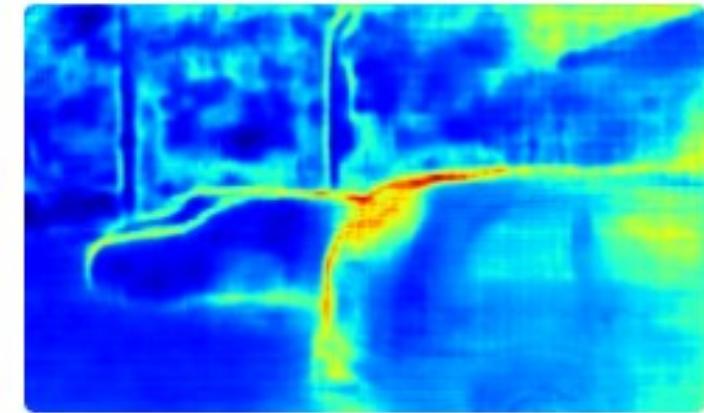

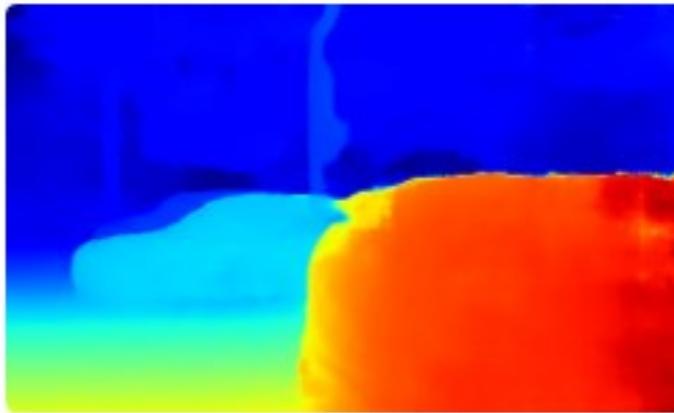

Can we visually interpret the result

B. Zhou et. al., CVPR, 2016

Uncertainty

An example of why it is really important to understand uncertainty for depth estimation. The first image is an example input into a Bayesian neural network which estimates depth, as shown by the second image. The third image shows the estimated uncertainty. You can see the model predicts the wrong depth on difficult surfaces, such as the red car's reflective and transparent windows. Thankfully, the Bayesian deep learning model is also aware it is wrong and exhibits increased uncertainty.

Trends in Deep Learning

- Unsupervised → Supervised → Unsupervised
 - Started from feature learning for other ML
 - Now, supervised learning is main stream
 - The bigger, more expensive and more complex
 - SOTA wars
 - Return to unsupervised learning such as GAN at research field
- Single modal research → Multimodal research
 - Image/Video : SOTA
 - Sound : SOTA
 - Text : Near SOTA
 - Combination of the above modalities

Trends in Deep Learning

- Difficult for humans but easy for computers
- 
- Easy for humans but difficult for computers(Now)
- 
- Difficult for humans and difficult for computers

Challenges of Deep Learning

- Extract information from unlabeled data
- Develop a theoretical understanding of neural networks
- Tap into the potential of transfer learning(AGI)
- Scale for distributed big data & optimization for mobile

Deep Learning 우선 활용 분야

- 복잡한 언어처리가 필요 없는 분야
 - 재무, 유통, 생산
 - 통계적인 성능이 높으면 되고, 실수가 치명적이지 않은 분야
 - 바둑, 체스, 퀴즈
 - 의료, 교통??
 - 여러가지 능력이 한꺼번에 요구되지 않는 분야
 - 품질 감별, 단순 노동
- 아직까지는 약한 인공지능의 시대...

Good Example

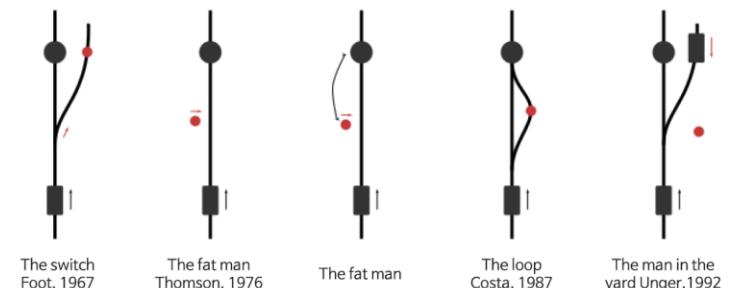

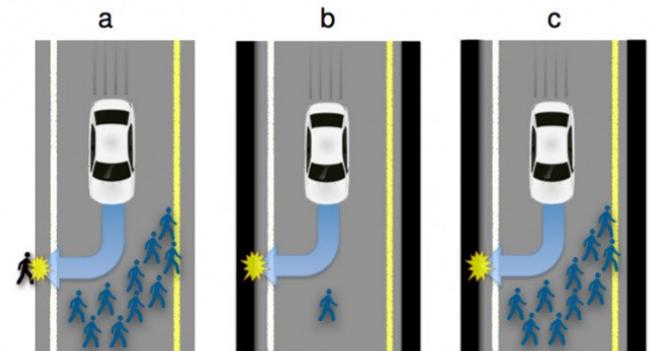

MISO ROBOTICS PRESENTS

Deep Learning은 만능?

- 동유럽국가 몬테네그로의 수도는 어디인가?
- 바둑판을 1줄씩 늘려서 20×20 으로 만들고 지금 당장 이세돌과 알파고가 대결한다면?
- 의료 data를 분석하여, 수명을 예측해봅시다
 - 평생 한번도 담배를 안피운 사람
 - 현재 흡연을 하고 있는 사람
 - 과거에 흡연을 했다가 끊은 사람
- 인공지능은 인류의 지능 향상에 도움이 되는가?
- 인공지능의 능력이 커질수록 법적, 도덕적 문제에 대한 해결이 필요
